In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly. |

Models and Frequency Coverage |

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150

148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81. |

Minimum Volume Setting |

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely silence the receiver at minimum setting of the volume control. |

Tone Alert Feature |

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. |

Repair and Replacement Parts |

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics |
PO Box 212 |
5138 Laurel Ln. |
Broad Run, VA 20137 |
telephone (540) 347-7760

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and

feature priority scan and a separate trimmer capacitor for
each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X
SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from
the crystals used in the conventional single channel
Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

That's nice.

Where is it? What's the asking price? What's its condition?
What are the terms of sale/delivery?

It always amazes me that people post "for sale" ads with so little
vital information included. Good thing most of us know
what an 87A is.

I've actually seen this ad:

"for sale
radio
email me"

and the poster has munged both his (F)rom and his (R)eply-to.

>carrier as I would in the tool box).

For the money and security, spend $20 for the appropriate marien battery box
with the single hole for the vent, many have locks too. I could see a
potential accident with the 2 year old if s/he deceided to stick some wire or
other conductive device through the holes in the pet carrier. It's not the
12volts you nned to worry about, its the 150 amps behind it that could be a
problem.
>
>Questions:
>
>1. What car, marine, etc. heavy duty battery is best?
> Critical Specs
> or
> Specific Model

I cannot recommend specific models, but I do know a Marine battery is more
designed for this type of activity thatn a regular car battery. The marine
battery was meant to be "deep cycled" and have most of the power taken out of
the battery and then recharged. If you were to do this to regular car battery,
you'd destroy it about the fifth time you drained the battery. Regular (car)
batteries are meant to stay fully charged.

>2. What battery charger should I use to prevent damage to the battery and
to keep it
> properly and fully charged - without generating rf noise in the
>process (and to
> preferably have a reasonably accurate display of the battery
>condition).

There are chargers that are specifically for Marine Deep cycle batteries, as
they cannot be recharger *porpoerly* with a regualr charger, although it may

work. It won't promote longevity of the battery, which will likley cost in excess of $100. Marine batteries and regualr car batteries are entirely different batteries with entirely different charging requirements.

There are also devices that will charge a battery if the voltage drops below a certain level. This insures that your battery will stay topped off, but I am uncertain as to whether this type of charger, and "topping off" s a good practice for a marien battery.

If you're concerned about the noise from the charger, which you will likley get since the charger is not filtered, a few capacitors from radio shack will easily filter the noise or you can buy a regular car stereo noise filter fro radio shack.

I am reminiscing after receiving the latest Swan Net newsletter and would like to acquire a Swan rig again.

I am looking for a rig that doesn't have to be museum quality (I intend to use it!), needs to be at least marginally functional (I'll tinker with it over the winter), must not have been "hacked" (modified, rewired, drilled, etc. - don't care if 3-sided case cover has been poorly painted or is scratched, I can repaint that, the face needs to be reasonably intact)

I want only one of the following, and in this order of preference (from most to least wanted):
750
500CX
500C
350D
Others considered.

Price IS an object! This is to be my toy rig and I have very limited financial resources. Value will be assessed to include the condition of the finals, physical condition, operating condition, shipping cost (I'm in So. NH), etc.

I Also Need A Power Supply (Preference in this order):
Swan 117XC
Swan 117C
Galaxy PSA-300
Galaxy AC-400
Hallicrafters PS-500
Galaxy AC-384

Other Accessories Sought:
WM3000 Wattmeter
FP-1 Phone Patch

Thanks for any offers, or suggestions of sources!

>When AMPS was designed, it would have taken a truck full of electronics
>with its own generator to meet your requirements. I hope you're not an
>engineering student. *sigh*

When *was* AMPS designed? Would it not have been relatively easy to include some simple form of scrambling like voice inversion, even at that time? And certainly *something* more sophisticated could have been added to the system by now. Certainly, it would cost something, but plenty of people would be willing to pay for it if it was marketed honestly. Make it clear that the standard phone is easily receivable by the public, while the scrambled phone (which costs more) is not, and let the market decide.

Instead, we have a radio system which pretends to be part of the telephone sytem, including the expectation of privacy that people have come to have from landline phones, yet the over-the-air system is completely in the clear using a very common modulation. And when these security concerns are brought up, the response of the industry is not to acknowledge that the system is easy to listen to, nor to design in some security, but to push for laws making listening illegal.

Now, these don't really seem to be technical issues. I find it extremely hard to believe that *all* of the engineers who designed AMPS were completely unaware of the privacy issues. And I think it completely implausible to believe that privacy could not have been improved by technical means in (say) the last 5 years. But the decision to push legal methods of giving the illusion of privacy rather than just fixing the problem was certainly the decision of the cellular industry.

Dave

PORTABLE SHORTWAVE RADIO

1. NATIONAL PANASONIC MULTIBAND MODEL T-100MD FM-AM 4 Band 12 Transistor 5 Diode. This radio appears to be in decent shape. Obviously this is not a Zenith Transoceanic, but for some of the radio buffs who are into vintage Japanese radios--it may be of interest. The Radio's only problem is the corroded 7 D cell batteries that have to be replaced. From what I understand radio worked the time wife's Aunt used it years ago before she went into nursing home. It does not run on AC current--strictly a deluxe portable for its time.

Radio's Controls, Etc.:

- Illuminated Dial Button
- Band Selector: FM; AM; MB; & SW.
- Internal Telescoping Antenna
- AFC Switch
- Tuning/Battery Level Meter
- Off/On Volume; Bass & Treble Knobs
- Tuning & Fine Tuning Knobs
- Aluminum World Time Table Rotating Dial on back of radio
- Has bunch of inputs/outputs

1. MPX
2. EXT. AMP
3. Ant.
4. Earth
5. Phono
6. Phono/Radio Switch
7. Earphone
8. FM EXT ANT (Two jacks)

Will consider any reasonable cash offers or swap for a military type or Hickok type tube tester.

There are at least two different feedline configurations being
provided with the commercial G5RV's. Some use a heavy duty twinlead
and others use ladder line. The physical arrangement of the
transition at the junction of the coax with the twinlead also varies.
Some use ferrite beads in a plastic tube and others use a simple
transition form balanced line to coax. There may even be some with a
1:1 Balun at that point. The only important variables across the range
of G5RV installations seems to be the length of the coax and the
included angle of the Vee.

If the coax at its far end, (i.e., at the junction with the balanced
line, is seeing 50 +j0 (which is rare), then the length of coax is
essentially immaterial. However, if the impedance is other than 50 +j0

with its consequent SWR, then the complex impedance seen at the transmitter end of the coax can be "all over the Smith Chart", as it were. One thing that "should" be constant for any reasonable length of coax at a single frequency is the SWR, although it will diminish slightly with longer lengths of lossy coax.

The only way that I can understand an SWR of 5:1 or more everywhere in every HF band is either a fault in the coax or the inverted vee configuration. If your dimensions are accurate, then the included angle is 112 degrees, which is fairly common. The only other possibilities are:
a) poorly installed connector
b) defective coax (struck by lightning?)
c) really bad physical unbalance (i.e, the coax doesn't come down symmetrical with respect to the two legs of the antenna)

Each of these possibilities can be resolved with some simple tests. Disconnect the coax at the point where it transitions to the balanced line and measure its characteristics with it shorted at the far end. With a 70 ft piece of coax, knowing the Velocity Factor, you should be able to measure the min. SWR frequency at the 1/4 wavelength frequency. The VF can be .66 or .8, depending on the type of RG-8 - I will assume .66. The formula is quarterwavelength (ft) = VF x 246 / f (MHz). Using this formula and 70 feet of shorted line, the frequency at which SWR should be minimum is 2.32 MHz (if I've done the numbers correctly). If that test doesn't check out within a reasonable tolerance, then your coax must be bad. If you are unable to disconnect the coax at the transition in order to make this test, then you will have to take the antenna down and disconnect the dipole legs from the balanced line and check the combined balanced line and coax together.

Continuing with the assumption that the balanced line is 31' of 300 ohm twinlead, then working around the Smith chart from a shorted line consisting of the balanced line plus the coax, you should see minimum SWR at 2.65 MHz, if the line is not defective.

While we're on that subject, W6RCA's Basic program for doing feedline calculations shows that a G5RV should have a somewhat shorter length of balanced line (when on 80M) than the 31 feet normally used. I hope I'm doing something wrong here, but the calculations suggest that 20 to 27 feet would be a better length for 80 M. Unfortunately, it wants to be more like 33' for 40 M, etc. As you can see, the G5RV design is not perfect - it's a compromise for all execpt 20 M. That's where it's supposed to present the better match. Since you do not get a good match anywhere within the 20 M band, there must be something defective in your line (I am discounting the possibility that you have something large and metallic very near to the dipole itself, or that there is a defective insulator at the end of the antenna, or that you have done something dumb, such as using a metallic support wire instead of rope at the ends of the antenna, or that there is another wire antenna parallel to and within 1/4 wavelength of the G5RV..

Simple inspection of the way the feedline comes down will determine whether or not it is symmetric with respect to the dipole halves. An angle of less than 60 degrees with either leg would be cause for concern.

The bottom line is that G5RV is NOT a bad antenna - but yours may have a problem.

Dear Tony,
It doesn't take as long to remove the word "nospam" as it does to give
the un-helpful response that you gave the original post.

So, exactly why did you bother?

Hi

I have recently purchased a TM-V7e Dual Band Mobile tranceiver by Kenwood. Unfortunately the radio has not had the extended receive modification and I am limited to just 2m and 70cm. Could someone be kind enough to send me the information I need to expand the receive capabilities of this fine radio.

Many thanks,

Anthony GW0WXO

I bought a DJ-S11T handheld 2 months ago and had to return it twice, once for antenna, second time for no power. The spec says 300mW output but it barely hits a very nearby repeater that I can hit with my other HT at 100mW. Because of the services and politeness you get at Alinco I have regrets on having bought this one. (By the way, all they did to the antenna was to fix it with crazy glue.) Wonder if anyone had same of similar problems.

Source record: 162831

Dear co-hams,

I've got some trouble with my FT-757. Before I start digging into it, I'd like to find out if anyone encountered this particalur problem before and solved it, because I've got very little spare time.

Config:
FT-757-GX (first model) with junker key connect by mono jack.
Worked fine for years.

Then: CW stopped functioning. Reason: CW processor died.
Replaced it (not cheap!).
Everything OK.

One year later:
From one moment to another, CW stopped functioning again. Different problem:
Processor works alright, but keying only works with mode switch in LSB, USB, AM and FM, so in every mode except CW-wide and CW-small.

When in CW mode, keying works (without processor functions) when PTT switch is used.
I thougth this didn't work when the rig was OK, but I'm not sure. It seems some function somewhere is inverted, so maybe an Inverter blew.
Anyone had this before? Please mail to Rob.Soulier@inter.NL.net

Source record: 162838

Remove the bottom cover on the radio. Near the front of the radio you will see another smaller board (this is the digital board). In the vicinity of a copper spring that contacts the digital board to the radio casting, you will see a row of resistors labeled 0 thru 5 or 0 thru 6 (can't remember the exact number. Remove the resistor in position 0, which is the one closest to the copper spring. It's best to not use heat, but use a small side cutters and cut the thing out. It's very simple.

BTW, I have some extra IF filters (both the 450 kHz and the 455 kHz) to make this radio much more selective if anyone would like to improve the selectivity of their radio like I did. Just let me know.

That's pretty much the case in Canada too. The annoying thing is
that most radio equipment sold in Canada is identical to that sold in
the U.S., so most receivers available here have these two particular
notches carved out of the 800 MHz coverage, even though there is no
law requiring that here.

I take my G5RV camping and it works great as a dipole
or an inverted vee strung up in the trees. I use my TS-570D
with the built in tuner.

Hi Gang --

Stumbled across this one and thought... hmmm, better your pile than mine.

The case is about a quarter of an inch longer than an FA style with pin spacing the same as the FA. Obviously a sideband filter for something. Make an offer if you're interested.

Gene,

The JPS unit (ANC-4) also has an input for an external noise antenna.
It also has a money-back guarantee if you don't like it. Buy one, see
if it takes care of your noise problem, and if it doesn't, send it
back. All you're out is shipping.

2071. FS: OLD REEL TO REEL & CASSETTE RECORDERS

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-01 00:00:00 UTC
From: l.mclaughlin@popmail.csuohio.edu
Message-ID: <63dvu4$7q1$6@csu-b.csuohio.edu>
Source record: 162910

OLD REEL TO REEL & CASSETTE RECORDERS (need some level of repair or for parts)

1. SEARS MODEL 7230 - needs repair

2. REVERE T-1100 - needs repair, no power cord

3. TELECTRO 1/4 track and 1/2 track - Plays but has hum. Seems like a weak tube.

4. WOLLENSAK 3M 2520AV - Commercial service audio cassette recorder used with presentations. Has various inputs and outputs not found on home duty equipment. Decent condition. Have gotten around to trying it. $40 if sold separately.

5. WEBCOR COMPACT DELUXE EP2402-1. Needs repair or for parts. Case Top missing

$125 for the lot. Will sell individually for $25 each. The Wollensak 3M 2520AV is $40 if sold separately.

Will take military type or Hickok type tube tester as swap for above. Shipping & handling extra.

Bob, you don't need to break the connection between the coax and
balanced line to do this test. Just short the junction.

Date: 1997-11-02 00:00:00 UTC
From: boscoe@worldnet.att.net
Message-ID: <63i263$lca@bgtnsc03.worldnet.att.net>
Source record: 162773

My Realistic (i.e. Radio Shack) HTX-202 has developed the following problem:

Whenever I run it with the Ni-Cad battery pack, the display *always* shows the "BATT" message AND, if I press the PTT button, automatically shuts off.

Everything works normally when connected to power via external DC.

I have checked the battery with a multi-meter and it presently shows an output of 5 VDC.

Any suggestions/advice would be appreciated.

Thanks in advance.

I recently received an HT1000 VHF that I no longer need.

MDL# H01KDC9AA3DN
SRL# 402AWYE803

16 channels
TPL/DPL
Scan
The radio is in great condition.
All the usual stuff. Comes with antenna, Ultra High Cap battery(ntn7144),
and rapid charger.
I do not know the exact value of this radio. I have sold a few UHF HT1000
radios on this group in the $325 to $375 range. Is the VHF model similarly
priced?
I'll take the best offer over $300.
Email if interested.

Hello Gary,

I wondered if one could do that, because I didn't like the idea of
having to undo that connection. I tend to be conservative, so I
suggested doing it in the way that would be least risky in terms of
"strange effects". What I should have cautioned, however, was to make
sure that the balanced line portion is up off the ground, and straight
and in the clear of any metal stuff when you make the measurements.

Browning Golden Eagle Mark III three pieces sold as a
set $600.00. Overall appearance is very good to
excellent & it was working
when removed from service. There are no books or
microphone with it. Each piece has a metal case w/
faux wood grain covering. Front panel &
markings on all three units are excellent. The only
observed problems with these units are as follows:
Receiver has a few light rust spots on the
transformers & chs. Transmitter has few light rust
spots on the transformer. SSB15 Transmitter has 1
spot of chs rust & there is a good deal of flaking of the
faux wood grain case covering on top.
Price + S&H from Baltimore, Md. Will consider reasonable offers. International
shipping
available. Contact vintel@aol.com to order.

Also

The following items are in " as-found" condition, were part of a radio collection I
purchased this past summer.
Eico ST40 40Watt Stereo integrated amp w/cage. Cosmetically very good to excellent,
front panel markings excellent. Rectifier tube broken, missing fuse cap. Not tested.
$60.00. To see a picture of this item goto
http://members.aol.com/vintel/4503.jpg

Eico mono integrated amp HF32 w/ cage. Cosmetically fair to good, some rust on chs &
cage, front panel very good. Not tested. $30.00. To see a picture of this item goto
http://members.aol.com/vintel/4504.jpg

Bogen 12Watt mono integrated amp DB110 w/cage. Cosmeticall good to very good. Not
tested. $30.00. To see a picture of this item goto
http://members.aol.com/vintel/4526.jpg

Bogen 12Watt mono integrated amp DB110 w/cage. Cosmeticall fair, severe rust right end
cage & chs. Not tested. $20.00. To see a picture of this item goto
http://members.aol.com/vintel/4525.jpg

Radio Craftsmen mono power amp RC2, no cage. Overall condition very good to excellent. Dirty but I don't see any pitting. Missing bottom plate, power cord poor. 6V6 P-
P outputs, works well. $120.00. To see a picture of this item goto
http://members.aol.com/vintel/44354.jpg

Heathkit mono power amp W5M w/cage.Overall condition very good, little rust on cage.
Chs is dirty & has a little rust, all markings are very good. Has Genelex KT66 outputs,
works well. Fuse & fuse cap missing. $195.00. To see a picture of this item goto
http://members.aol.com/vintel/4391.jpg

All prices are + S&H from Baltimore, Md. Will consider reasonable offers. International
shipping available. Contact vintel@aol.com to order.

Wanna help me get back into radio?

I'm 54 years old trying to live on Social Security disability. My wife of 20 years threw me out a few weeks ago. It turns out the main reason was undiagnosed Manic/Depressive disorder. I miss my family. If I don't find something to take my mind off of the loneliness don't know what I'll do.

I hold and advanced license but haven't used it for years. Do you have a working rig you don't want an arm and a leg for? I'm not asking for anything free, I just can't pay very much. Maybe you have a backup rig in the closet you haven't used for years.

I have a Kenwood TH-21AT I can't use. I bought it for my wife, spent $150 to send it back to Kenwood for alignment, etc. about 3 years ago. She never used it and now I live in an area where a handi-talkie doesn't work well. Maybe that could be used as part trade for your rig?

Cant ship these but will deliver 1\2 way within reason from Midland\Odessa, Texas. #1. Henry 2kd-5 amp, full out put from 2 @ 3-500Zs. In good physical shape for its age, and looks and works well. I will not ship it as I have tried and failed on rigs this heavy. Its a desktop linnear , but barely, it must weight 70 lbs. $700.oo and I will drive up to 100 or so miles to meet you if necessary. #2. 2 element 40 meter Yagi, HiGain Discover 7-2 latest model with balun and in good shape. Been up in Texas for about 2 years. Linnear loaded, no traps, and works well on 17 meters as well! $250. and Ill meet you. I could deliver in OKC area in mid november, I could deliver in Austin area in late november! Its not torn down completely and I dont want to!!.... Email with interest! Thanks Murray Neece

Source record: 162790

I am a new ham and I am looking to trade these ham radio items for something like a single band 10 meter rig, or any other cheap type rig that will get me on HF when I upgrade. Also SWL revievers will be considered.

For Trade:

*Azden PCS-3000 2 meter FM Mobile. 10 memories, PLL tuning, 25 watts output, detachable face (optional adapter required). Works great, but no microphone. (I have the mic plug and the pinout for the mic, but not the element itself). There might be a PL board build it, but I am not sure. Fair condition.

*Ranger RCI-6030 VHF-FM Marine Mobile. 25 watts high/1 watt low, all USA and International VHF Marine Channels, plus 10 USA/Canada weather channels, Dual Channel Watch, Backlight LCD display displays status of setup functions. Includes microphone, and cigaratte ligher plug. Very good condition.

*Bearcat 100XL Portable Scanner. Covers 30-50, 138-174, 406-512 MHz. 16 programmable channels, PLL readout, LCD display, Search feature. Uses 6 "AA" NiCads or Alkaline batteries.

*Motorola DPC-550 Cellular Flip Phone. Dual Mode, one acts as a normall cellular phone allowing you to make calls, and the other mode is a "scanner mode" which makes the phone act like a "cellular scanner" and can even do "Trunk Tracking" mode with PC software. (Inluded). 3 batteries, fast dual charger, car DC cord. Please contact me for complete info on this.

Please e-mail me with any offers. Will consider most offers. I am in the Philadelphia, PA area.

-Everything works normally when connected to power via external DC.
-
-I have checked the battery with a multi-meter and it presently shows
-an output of 5 VDC.

Sounds like a bad battery pack. That pack should be putting out 7.2V.

If it isn't taking a charge, it may have some bad cells. Either zap them
or replace them.

Your battery pack probably has two bad cells. It contains 6 cells,
which should each measure about 1.2 volts during most of the discharge
cycle, for a total pack voltage of 7.2 volts. When fresh off the
charger the voltage may be 1.4 or slightly more per cell, for a total
pack voltage of about 8.4.

The fact that your BATT indicator is always on indicates the voltage
is low. The HTX 202 is designed to totally shutdown when the voltage
gets too low, since discharging a NiCD pack totally can damage it by
reverse charging the weakest cells. When you try to transmit the added
drain pulls the voltage down to the shutdown level.

I made the following measurements on a new HTX-202 battery pack:

Sitting for several hours after receiving full charge: 7.8 V
Voltage at which shutdown occurs: 5.4 V

If you belong to AMSAT, you probably know what this is. I won this as a door prize at Dayton this year, and finally found out what retail is on this unit.

This is a Kansas City Tracker/Tuner Version 2.43A. It is still in the box (which has been opened) and the interface card is still in the anti-static bag (not been opened). Included is the cable (DB25 to DIN) and software on a 3 1/2" disk.

I would be willing to settle for $275 or trade for a late model 2M HT (preferrably a Kenwood).

Wrong! The Yaesu FT-50RD and the VX-1R support DPL. Even the Yaesu
FRS radio supports DPL. Yaesu calls it DCS, but it's the same thing.

From: jjn@zamco.co.uk
Message-ID: <345bc4ae.9729102@news.ftech.net>
Source record: 162810

There are a number of variants of the FT-50 for different areas of the world. Can you help me identify which ones are for where/what they do ?

Type A seems to be USA frequencies & repeater shifts (-.6/+5.0)
Type C seems to be UK frequencies & repeater shifts (-.6/+1.6)
Type F seems to be unrestricted but with no repeater shifs set up

The Hex byte at 05E3 in your saved RDF files identifies the variant
00 = F
01 = A
02 = B
03 = C
04 = D
05 = H
06 = "Free Band"

There is also a sub-band indicator (00 to 03) which I would like to decode.

If you have any info which can help me understand the options or regional variant RDF files other than normal USA or UK then please email a copy to me.

2132. ADMS for VX-1R allows cross-band

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-02 00:00:00 UTC
From: dddavis@atl.mindspring.com
Message-ID: <63gta3$lpt@camel18.mindspring.com>
Source record: 162859

I just bought the ADMS programming software for the VX-1R today, and I am happy to say it does support cross-band splits. As others have posted, some firmware versions do not allow entry of cross-band splits from the keypad, but the software does. The folks at RT Systems did say that some early radios may still have problems with this feature, but it works OK on many.

Even if you have no interest in cross-band splits, the software is a good deal. There is also a special upgrade price if you already have the cables.

regards, Don (KE4KYO)

2139. FS: Homebrew 4CX1500B Amp $500

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-03 00:00:00 UTC
From: ae4cz@aol.com
Message-ID: <19971103023100.VAA01972@ladder01.news.aol.com>
Source record: 162716

I have a homebrew amplifier for sale. The bulk of it was purchased as military surplus. It consisted of two 4CX1500B tubes, sockets, and chimneys. It was designed to operate as a sonar amp on audio frequencies so it did not have an RF deck. I purchased all the parts needed to make it a ham amp and assembled it using only one of the tubes. The cabinet is on wheels and the thing weighs over 100 lbs (the transformer is huge). It is as wide as a rack mount (19 in), 2 feet tall, and 17 in deep. To make a long story short, the amplifier works and puts out 900 watts CW on 10 - 160 meters. I think I need a parasitic mod because I have trouble tuning it on 20 and above. 40-80-160 seem to work great.

I will try to sell this amplifier as is for a few weeks before parting it out. It consists of the following that I have purchased:

Military surplus amp---$250
2 @ 4CX1500B Pulls ($100 ea)
2 @ SK800B sockets ($30 ea w/chimney)
2 @ SK806 chimneys
3500 V transformer ($50)

Jennings UCSF-500 vacuum cap (12-500 @ 7.5 kV)--------$100

Jennings CVCC 2500 (25 - 2500 @ 6 kV)--------------------$100

2 @ Groth turns counters $35 ea--------------------------------$ 70

32 uF @ 4.5 kV power supply capacitor------------------------$ 36

B&W 852 tank coil w/ integral bandswitch---------------------$ 60

HC1 Kilovac SPDT vacuum relay (same as RJ1A)------------$ 40

Meters, relays, knobs, chokes, doorknob capacitors,
power resistors, hardware, etc.-----------------------------------$??

TOTAL
-----------$656 +

PURCHASE PRICE FOR ALL PARTS AS IS:-------------$500 firm

My plan was to redo the amplifier and put the second tube and socket back in it to boost the power level but I do not have the time to work on it. All the parts are heavy enough to handle the load. I hate to part it out because the amp does work and it has many features of high quality commercial amps (voltage regulation, timer delays, vacuum relay, overload protection, vacuum capacitors, etc). I have drawn the schematics for all boards on the amplifier (most are original commercial but a few are homebrew).

I am certain I can get at least the $500 if I part out the amp. If you are interested, please call, email, or stop by my house to check it out. Unfortunately, as heavy as this amp is, I cannot ship it.

From: Tom Gasta <tomgasta@worldnet.att.net>
Message-ID: <63jj8j$82h@bgtnsc03.worldnet.att.net>
Source record: 162718

It sounds like you may be confusing the VX1R's "true" Digital Coded Squelch (DCS) with that of other ham manufacturers that call their DTMF Tone decoding/encoding system "DCS". The VX1R and FT50/40/10 DCS made by yaesu is the actual commercially used Digital Coded Squelch(DPL) system similar in operation to the CTCSS (PL) found in most ham rigs today. Rather than encoding a continuous subaudible tone for decoding by other radios set to the same tone, the vx1r DCS encodes a continuous digital address string selected by you with the radio, about 100 various codes are standard. This data string is virtually sub audible as well, but is decoded by another radio set to decode the same 3 digit code, and in the world of ham radio, that equates to either the yaesus mentioned above or a commercial radio like Motorola or GE.

I know that many other manufacturers claim a "DCS" function, and that those usually involve the sending and decoding of a series of DTMF (Touch Tones), but this is not the case in the Yaesu, at least as far as their DCS is concerned. Your radio "mutes" because that is what it is supposed to do, opening only for a signal that is carrying the same digital code. Try setting the same code in two seperate radios (vx1's, FT10/40/50s) and you will see how it works.

Tom

>Boscoe@worldnet.att.net

First of all, yje HTX-202 battery is supposed to put out 7.2 VDC when
fully charged. If yours is reading only 5 vdc it is a bad battery.

Testing your battery with a conventional multi-tester means nothing.
You must check it under load and when you do thjat you will probably
find its falling well below that 5 volt reading -- which in itself is
to low for the HTX-202 to function.

Just so you know......DPL is only a "Digital Private Line" squelch control.
It uses a continuous digital pulse instead of a sub-audible tone to
control the audio squelch. It is NOT a audio encryption system. If you
have the capability (i.e. a Motorola repeater with DPL) you can use it on
the amateur band. You probably won't get any others using the machine
unless they have a commercial type radio and have the proper digital code
programmed for the repeater.

Hi to all, I have a Uniden/ Bearcat BC-200XLT scanner that receives
full cellular also the cordless phone frequencies. The 200XLT
is in very good condition. It has 200 memory channels, leather case,
manual and a good battery pack with charger.
I have seen this scanner on the newsgroups for 200 dollars.
I would like to trade for a Yaesu FT-50R with FTT-12 keypad
(if possible). The FT-50R must be in good working order on both
VHF and UHF bands. It can be cosmetically challanged as long as it is
fully functional. I will balance the deal with cash if need be. How
much cash depends on the condition of the FT-50R.

NOTE It may be illegal to receive cellular in your area.
Please e-mail me direct at: mrusso@hoflink.com
Thanks, Mark N2FLF

I think that is your problem. My manual has an addendum to it that
states to use only a stereo 0.25" plug to connect the key input. A mono
plug will damage the keyer circuit. You will probably have to do the
same repair again and switch over to a stereo plug.

Hi, waht do you want for mods? We had a 727 about 10 yrs ago, nice radio in its day. Out of band freq programming mod was use 110000 as the CPU reset code instead of the one listed in the manual, thats sort of ols hat these days,,.Know a few other tips and tweaks that were handy too: Wired the extra button above the main PTT switch(used normally for Euro tone burst I think) to work as a better Shift Function switch. Major drawback was that I never could get the rec to go above 160 MHz, even with extensive tweaking of the VCO. 73s Steve DE WA1YKL

From: Bill Richards <werich@qnet.com>
Message-ID: <345E8ED0.59C2A751@qnet.com>
Source record: 162742

I am hoping someone might be able to assist me
with a problem that just
surfaced with my FT-8100. I am not able to adjust
the volume on the right
side of the radio (440 side). The volume control
knob moves smoothly but
the volume does not change either up or down. The
left side performs normally.
I checked with Yeasu and they said send it in, it
is still under warrenty. But
turnaround time is about 3 weeks. Any suggestions
would be greatly appreciated.
Thanks, and have a great day.

Thanks Peter for the reply. I'm using a full wave horiz loop fed with
450 ohm ladder line through the balun in a Nye tuner. BTW, I was also
getting the same problem on 80m at one point, but it "went away" on 80m
(just a normal dipole with choke balun at feedpoint, 1:1 match). It does

sound suspiciously like RFI in metering circuitry, doesn't it. I have a few 8 ft rods in the earth a few feet outside the window connected to the shack with 1" braid. Still, there may be rf in the metering circuitry.
Don't know. Thanks for your ideas. Any more, let me know.
George

Hello everyone,

I am having a problem with a Kenwood TS-690S that I am using on 50 Mhz, the reciever seems to be VERY insensitive, I wonder if there are any mods that I can do or maybe something that I can look for in the set to fix this. It seems to OK on HF so maybe it has something to do with the 6 m section of the RX.

Any information would help !

Thanks,

Source record: 162672

I use the MFJ more for measuring inductors. I have a 50R resistor with clips on each end. I have a selection of ceramic caps in the box to choose from.

I screw in a plug that has two short clip-leads and arrange the 50R resistor, the unknown L and the known C all in series.

At a certain frequency the XL and XC are equal and opposite in value. They 'disappear' and all the analyser sees is the non-resonant 50R. A deep nul is indicated. A counter or a known accurate Rx will give you the exact frequency should you need it.

Back to the spreadsheet and plug in the numbers - viola - (very musical) there is the value of the series resonance of the unknown L.

Designing VFOs was never easier.

Yeah send it in and tough it out. If you mess with it the warranty will be void. Better yet contact them back and ask if they have any authorized service centers you can send it too. They usually have a shorter turn around

Bill Richards wrote in message <345E8ED0.59C2A751@qnet.com>...
I am hoping someone might be able to assist me
with a problem that just
surfaced with my FT-8100. I am not able to adjust
the volume on the right
side of the radio (440 side). The volume control
knob moves smoothly but
the volume does not change either up or down. The
left side performs normally.
I checked with Yeasu and they said send it in, it
is still under warrenty. But
turnaround time is about 3 weeks. Any suggestions
would be greatly appreciated.
Thanks, and have a great day.

Yes you can program the cell phones to only dial certain numbers. That is user programmable by you or a representative. Next best thing is a Trunked radio. Motorola has numerous repeaters around the nation and you can buy time on them and also have the ability to use a phone patch. And this will work on a HT.
Lon Ponschock wrote in message <63bbqt$7om$1@earth.execpc.com>...
Hello,

My first time in here, so please excuse any jargon gaffes. :-)

I am looking for a 2 way communication system for emergency
use by route drivers.

The system should be able to contact/make telephone
connections.

The system must communicate 100+ miles.

The system should be a dedicated to emergency use by drivers.

The system should be able to contact a pager and leave
an emergency message to 'on call' staff.

==> A high power walkie talkie might be one answer.

I have rejected cell phone usage for it's lack of
security (random calls) and expense.

Can someone point me in the direction I need for this
application?

cc:lon@execpc.com

.... and thank you for your attention.

Jim,

There is no "pulling" here, just the chance for you to set things right. The rotor you sold me as "mint" was a sanatized junker. You knew that when the unit was opened and the motor was replaced.

Read your own words from August 26th. In response to my ad looking for a T2X and in plain English you tell me "...It is 5 years old and only used for contests about 6 times and outside about two days each time". On good faith I sent you $350 and received the rotor. When it failed to operate I opened up the cases and discovered what you had sent me. After failing to get a reply from you I did a bit of digging in the rec.radio.archives. I discovered three of the postings by you dated August 11 stating "...tower is about 11 years old and is in perfect condition, it is topped by a 20 foot heavy duty mast. items that go along with the tower.....Hy-gain/Telex "Tailtwister" rotor and control box".

How do you explain that? Telex confirmed that the unit with your serial number was manufactured in 1985. Where do you get five years? And how do you get "mint" from a unit that has been out in the weather for eleven years? I am sorry, but I don't buy the line that a ham tested this unit for you. If this were true, you would have had him contact me to verify the serial number and his testing.

I will afford you a copy of the bill when the rotor is returned from Telex. This will show you the condition, cost and resources required to repair the unit. The bill will includes the serial number of the rotor you sent me and you can compare it to your records. This will take about two weeks and buy you some time to get the money together. I will continue to persue recovering my money from you until this matter is settled. I am not going to let it slide, it is a matter of principle now. I hope you will take this opportunity to right what happened before it becomes embarrassing for each of us. It is simply not worth $107.....

If you want to discuss this matter further, call me.

Thanks,

Bill

For Sale:
66 foot Self Supporting Tilt-Over Tower, VERY HEAVY DUTY....
this tower is about 11 years old and is in perfect condition,
it is topped by a 20 foot heavy duty mast.
items that go along with the tower.....
Hy-gain/Telex "Tailtwister" rotor and control box
KLM KT-34 4element HF Beam, about 8 years old...
cushcraft 2m and 220mhz yagis, and 2m AEA isopoles...
hundreds of feet of belden 9913 coax, rotor control wire etc...
I am moving and can't take this with me, this is all being
offered at the sacrafice price of $800.00 Canadian...
however, you must take it down, and remove it by August 30th.
if your interested give me a call at 519-542-8529 evenings, or
leave a message at 810-679-3535 anytime.
The tower is located at 874 Rosedale Drive in Sarnia, Ont.

73,
Jim Meyers NM8X/VE3
e-Mail nm8x@mnsi.net

Jim,

Perhaps I wasn't clear enough for you.

You advertised the rotor to be five years old. It was manufactured and
purchased eleven years ago.

You claimed in your e-mail to me that you used the rotor only occasion
in a portable mode for contests. In three of your Newsgroup ads you
state that it was used in the heavy duty tower for eleven years to turn
a HF and VHF yagis.

You claimed in your e-mail to me that the rotor was in mint condition.
The brake wedge was locked to the housing by corrosion. The lower ball
bearing race was damaged by rust from water damage. The two upper ball
races were severely worn. Telex has inspected the rotor and confirmed
the age and serial number to be true. Telex also confirmed the serial
number and date of replacement motor previously installed.
Telex described the condition as poor. To make the unit functional they
will be replacing the brake solenoid, wedge-slide, lower housing and
all ball bearings.

Now you tell me a friend checked it out for you, yet you don't say who.
And, to top it off you try to make me feel foolish with your comment
about freezing in shipment.

I am going to offer you an opportunity to correct what you have done to me. I have paid Telex $107 to rebuild the unit. I expect you to send me a money order for $107 within five working days. Or, you may send me a $479 money order for the original purchase price of $350, plus $22 for shipping and $107 for Telex, and I will return the rotor to you.

If you elect not to right this matter, I will seek damages, legal fees and costs to recover my original purchase and the repairs from Telex. According to your State Attorney General's Office your nine postings and e-mails place this matter within the statutes of interstate mail fraud. From my attorney's advise I am fully confident that your Small Claims Court will award on my behalf. I consider your actions to me to be a personal affront and I will devote whatever time and money it takes to pursue recourse. Please understand clearly, if I let you get away with this I will eventually become vulnerable to everyone I do business with. I hope you don't let this happen over $107.

Sincerely,

Bill Cotter

>73
>nm8x "Jim"
>
>
>
Jim,

I have sent you repeated requests to contact me regarding this purchase. I feel that you deceived me with the business of the rotor being 5-years old. I found your add suggesting that it was over 10yrs old as the serial number indicates. I expect you to contact me within 5-working days or I will pursue taking legal action against you.

Bill

Jim,

I am disappointed with the T2X purchase I made from you based on your description of: "It is 5 years old and only used for contests about 6 times and outside about two days each time. Was mostly used on a 4 element 6 meter beam or three element tri bander. The rotor is just

like new."

I sent you an e-mail below expressing my concern of the age of the unit versus your statement above.
You did not reply and I am not surprised.

Since that time I was been unable to get the T2X to operate. With all connections properly made and a TELEX service technician on the line, the problem was traced to the rotor unit itself. I removed the six bolts and split the motor housing to discover the entire bottom half of the unit was corroded and the lower ball bearing race was rusted beyond repair. The brake wedge was frozen in place and would not allow the unit to turn. The upper races were worn sufficiently to lead me to believe this unit was worn well beyond the paint job. The fact that a new motor was installed tells me that the condition should be no sup rise to you, if in fact you are the original owner.

I have sent the unit to TELEX for a total rebuild at their suggestion. The cost will be $107 including shipping. I would appreciate a check for $107 to restore this unit to the mint condition that you originally described it to be in. If you wish to discuss this matter further, feel free to call me at home 606-887-5563 or at work 606-323-6474.

Thanks,

Bill N4ALG

Jim,

Received the rotor Friday afternoon when I got home. Appeared to make it OK, you packed it quite well. I haven't tried running it, but will do that today.

I was a bit disappointed in the age of the unit. From our e-mail correspondence, you led me to believe it was only five years old and in good condition. The serial number indicates that it is almost 12-years old (manufactured in 1985). I hope the mechanical condition is as stated. I suppose I'll find out when I open up the housing. The price to have a T2X rebuilt is very reasonable and I would expect this rotor to be in as good a condition as a rebuilt unit. If what you said about using it only a few times and never having it permanently mounted is true, then it should be in mint condition internally. Otherwise, I feel you and I will need to renegotiate the deal to reflect the true age and condition.

Thanks,

Bill

I have for sale a MFJ 1278B Mult-mode data controller. This unit is about 4 years old and will send/receive 16-level Fax, sstv, packet, amtor, rtty and cw. Has dual ports for hf and vhf/uhf radios, built in mailbox, tune indicator, etc. It can be upgraded to the current mfj-1278 with epproms (if you just gotta have pactor) but will do just about everything anyway. Works excellent and includes plugs for Yaesu HF/VHF and Kenwood HT radio hook-ups. Note: this unit also has the 2400 baud packet modem. Includes MFJ software.
Sells for over $300 new, Asking $175.00.

Yaesu has finally started to offer DPL tone on amateur equipment. I
think the only one so far though is the FT50 dual band radio.
Hopefully others will soon follow suit.

If you want a truely private repeater, DPL is, for now, the way to go.

2194. Yaesu FT-2500 2m losing memories

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-04 00:00:00 UTC
From: jeffw@golem.ties.k12.mn.us
Message-ID: <t5oh40prb4.fsf@golem.ties.k12.mn.us>
Source record: 162684

Upon reinstalling my 2m FT-2500 into the car I find that almost
every time that I turn the ignition on, the rig spontaneously
turns on, too, and resets all memories to--nuthin!!!

The power on the rig is always toggled off before this happens;
somehow turning the car on is also powering the rig up and zapping
the memories.

Cigarette lighter, light ground wire, '91 Subaru wagon.

Any ideas?

Thanks!

Jeff Weiss

I suppose it has become ILLEGAL in the USA to write about certain
topics.
Soon, the FBI will break down your door to find the evil computers, or
pens used to write about illegal topics of discussion.

Next stop: Your vocal cords will be cut because you spoke about the
unspeakable!

Hi!
I'm building a linear amplifier and so far so good, except that I need a
toroid coil base, reference T200-2, where can I get this? I live in Portugal, so if you
could point me to a e-mail based trader!
Thanks in advance, a please also email your answaer to:

8950s have become very expensive and rare. I ran into this problem awhile back. You should be able to get them at www.tubesandmore.com That is the site for Antique Electronics Supply. They stock about every tube made "back then" and now. Last time I checked about 4 or 5 years ago they were 50 bucks a piece.
And beware they are very sensitive to be mistuning and overheating. They are a tv sweep tube which was used commonly in equipment from the 70s and on. DO NOT run that linear on am! Unless provisions are made for Class C plate or similiar modulation. The tubes WILL BE DESTROYED if run on AM in linear operation. Sideband is of course fine since that is intermittent operation and that would have been what it was designed for.

Jeff:

Try one or all of the following: 1. Check out your Subaru's electrical system. Particularly the connections on the the battery terminals, alternator, and CHASSIS GROUND to battery negative.

2. Beef up your rig wiring, and run heavier wire directly to battery

3. Put on a DC filter on your rig's power chord. Typically this is an electrolytic capacitor (100 uF+), choke, and another large cap. Check Radio Shack or equivalent to see if they already make one (think they do).

Jack,

I'm interested in this, but would only be able to offer you $50.

Let me know if you're interested.

Thanks

Mike

i agree with bill cotter. after reading all email messages
that the two of them had sent to each other, found that james had indeed lied
about the rotor. a rotor doesn't
leave one house in mint shape and five years old and show up in another house,
12 years old and beat up..

james do the right thing!! cause if not im sure it wont be forgotten and no
one will buy from you again..

I need a low power 440 radio. If any of you owners are unhappy and want
to sell a DJS41T (for less than $88), I'm interested.

My FT2400 did the same thing until I ran a pair of #10 wires directly to
the battery. No problems since. The cigarette lighter is not a good
idea.....

Joe
I hate to rain on your parade, but
the original Alinco HF radios did not use
"real" crystal filters. The Alinco uses
monolithic ceramic filters made by Murata(Japan)
The filters are centered on 455kHz, and Murata
make several versions, ie different bandwidths.
I don't have the Murata data book infront of me
but the number was something like CFJ455K8 or K5
I built a rf speech compressor using two of the
above filters, the widest ones. The filter characteristics
as measured on my HP 4194A gain phase analyser
show a decent response, but they had about 10 to 20
dB less ultimate stop band rejection as compared to
a typical crystal filter, or perhaps my measurement
jig had some blow by.
The Alinco's narrowest filter was the 1kHz unit so
when used on CW, the rig probably uses plenty of
audio filtering.
I didn't notice a new Alinco radio in the current
Japanese CQ magazine. Perhaps it will be mentioned
in next months magazine. Additionally, I didn't
notice it at the Tokyo ham fair earlier this year.

'73 Peter
(I am not sure but I beleive that the suffix indicates
the bandwidth, also these filters were used in the
some Kenwood radios)

2209. R5000 Kenwood Receiver Problems

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-04 00:00:00 UTC
From: ke3nj@voicenet.COM
Message-ID: <345F11F9.3466@voicenet.com>
Source record: 162699

Have a R5000 Kenwood Receiver that has a problem that developed after installing the chips for computer interface.

I may be wrong but I believe that that radio needs to be reset??

The receiver continues to scan and the band switch will change from VHF to HF and the freq. lock works.

Removed the chips for computer interface and problem still exists.

What is the procedure for resetting the R5000?

Any ideas or info??

Hello,name here is Dennis and qth is Ephrata,PA.
I have for sale the following stuff for sale.

I just bought a bird meter so I have these meters for sale.

1.) Kenwood SW-2000 power/swr meter,with the swc-3 coupler 1.8-54
mhz,200/2000 watt scale,
backlite & pep lighting with power cord,box,& paper work with service
manual paper for adjustments. 1-10 it is a 8. $110.00 shipped to ur
door.
```

2.)Kenwood SW-200 power/swr meter,with the swc-1 coupler 1.8-148 mhz,and
the swc-2 148-512 mhz.20/200 watt scale,backlite & pep lighting with
power cord,NO BOX,BUT WILL
PACK IT VERY WELL!!!,& paper work with service manual paper for
adjustments. 1-10 it is a
9. $130.00 shipped to ur door.

3.) 2 - Kenwood PG-4H interface cables,8 pin female to 8 pin
modular type plugs.
These are to be used with the Kenwood RC-20,and the IF-20.
They are used to connect Kenwood rigs TM-241,441,ect...to the IF-20.
Brand new never opened ,got spare ones ....more than i needed.
Buy 1 for $18.00 or both for $30.00 shipped to ur door.

I have to go by my memory on the years but....

The cellular concept was developed the 40's or 50's. Bell worked on it
in the 60's and I believe AMPS was standardized in the mid 70's.

Let take 1979 for an example year. How many scanners wer available in
1979 that covered 800 MHz? Not many. In fact there was not much
consumer equipment available that operated that high except TV sets. In
the 70's even hams had to convert commercial gear to get on UHF
(420-450) in most cases. So, though it was pretty lame, there was an
inherent level of security because the average Joe didn't have, and
couldn't afford the hardware to eavesdrop.

I think it is really a case of the cellular industry underestimating
consumer technology. Sure they could have added voice inversion, or
something similar as you suggested, but what good would it have done?
Again, technology today allows anyone with a sound card in a PC to
decode that. Just like any schmo can buy a scanner that can be modified
to cover the cellular channels.

> Instead, we have a radio system which pretends to be part of the telephone

> the clear using a very common modulation. And when these security
> concerns are brought up, the response of the industry is not to acknowledge
> that the system is easy to listen to, nor to design in some security, but
> to push for laws making listening illegal.

Why not? It's cost effective. I have never heard any cellular provider claim there AMPS systems are secure. I do remember the claims about how cellular service was as clear as regular phone - that was the only big lie I remember <g>. And they did design security. Digital cellular is available almost everywhere. It's biggest marketing point is better security (followed closely by the lie about digital sound quality <g>).

> Now, these don't really seem to be technical issues. I find it extremely
> hard to believe that *all* of the engineers who designed AMPS were

> implausible to believe that privacy could not have been improved by
> technical means in (say) the last 5 years. But the decision to push
> legal methods of giving the illusion of privacy rather than just fixing
> the problem was certainly the decision of the cellular industry.

I would also find it hard to believe the engineers were unaware of it as well. I am sure they were aware of the privacy *issues* but probabaly didn't think it was a major problem considering the technology of the day.

I personally like the idea of cellular eavesdropping prohibitions. I don't buy the arguement that you shouldn't write laws you can't enforce. It *can* be enforced. You can't catch every person who is speeding on the freeway, but t doesn't mean we shouldn'thave speed limits. It get enforced if you get caught. I also don't consider such laws to be unconstitutional - I haven't seen a thing in Constitution that protects one's right to be invade other peoples' private conversations.

I am no idiot. I know that my cell phone calls can be monitored. But if I caught somebody doing it, I can take action against them because they are violating the law - the law is tool tht can be used when applicable. But if you do it in the privacy of your own home and don't make it known that you are doing it, I guess you can go through life getting away with it. I don't care. Just don't do anything dumb that gives the radiocops probable casue to kick your door in.

Law or not, I can't see why its such an issue. I asked the scanner NG a long time ago, "what is the facination with listening to cellphones and cordless phones?" I was amazed that people had the cajones to be honest and admit that they scan for scandalous conversations - guys calling hookers, lying to their spouses, talking dirty, people making drug deals, etc. And then these mouth breathers got pissed at me when I called them vouyers! AFAIAC they rate right up there with peeping toms that use telescopes to look through their neighbors' windows.

So even if it was perfectly legal to listen in on cell phone calls I would still say that those who practice it are in need of a real life or mental health care.

Regards

I have indirect experience with their COR type boards (a friend has used many) for repeater projects- They are basically alright, but have the nasty habit of using speaker audio from the receiver for repeat audio, and therefore have less than optimum audio on TX. Reliability is ok, and they are easy to build though...

The DJ-S41T is good only if you have a dual band mobile working near you
in repeater mode, typically within 1/4 mile. I have heard the DJ-S11T
wouldn't even make a 1/4 mile. $88 is worth $88. How much is the
Motorola FRS by the way?

Sid

Hi, This is being posted to the Alinco mail list and R.R.A.E.
newsgroup:

Just received the October QST -- Alinco is advertising a new
HF radio, called the Alinco DX-77T. It looks a lot like the
DX-70T on steroids (same display, same buttons and knobs,
but in a "desktop" configuration). They did add an internal
CW keyer, and PL tones are now front-panel selectable, but
still there are some short-comings:

Now the questions:

1. What is the street selling price?
2. Why did Alinco omit 6 meters from this radio?
3. Why is there _STILL_ no built in VSWR meter?
4. Why is the CW section using an AUDIO filter? Even
the DX70 uses real crystal filters. Looks like the
DX77 has no provision for narrow filters either.

As an owner of one of the first DX-70 radio's, I've been
extremely satisfied with it. I've worked DXCC on both CW
and SSB with the small Alinco mobile rig. Needless to say,
I'm disappointed in the lack of better features of this
new HF rig. It looks no better than an Icom 707
or a Yaesu FT-600 -- which are really LOW end radio's.

What would convince me to buy the DX77 versus the DX70 --
I use the DX70 on a desktop with great results (ok...so
the TICK-2 keyer takes up a couple millimeters of space).
The receiver is better than the Icoms or Yeasu's.

Anyone from Alinco care to comment? Anyone try one of
these rigs yet? The advertisement doesnt mention type
acceptance -- has this been Type-A for sale in the USA?

thanks,
Joe

2234. Lowband/6 meter equipment for sale

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-04 00:00:00 UTC
From: Philip Barber <barber@virtech-nh.com>
Message-ID: <01bce8ea$e6e09340$LocalHost@virtech>
Source record: 162764
Cross-posted to: rec.ham-radio.swap,rec.radio.amateur.equipment,rec.radio.swap

Lowband/6 meter equipment for sale:

RCA Series 1000 mobile radio, model CMFM7MMRNC. 100 watts, presently on 39.xxMHz. Complete system with 4 frequency scanning control head & bracket, speaker, mic, mounting tray, and control/power cable. Noise blanker option. Also includes complete, original RCA 700/1000 series lowband service manual set in three ring binder. Clean, complete, working when pulled a couple years ago. $100.

RCA Supercarfone mobile, model CMFA50N2TT. 50 watts, 45-54MHz split, presently on 47.98. Complete system with 4 frequency 'integrated' control head with mtg bracket, speaker with mtg bracket, mic, mic hangup box, mounting tray, control and power cables. Also includes complete, original RCA Supercarfone/Superfleetfone lowband service manual set. Radio is very clean, head and cables complete, but a little dirty and worn. Working when pulled a couple years ago. $70.

Two 5 element 6 meter beams for sale. Both are complete and in good condition. One is a Cushcraft, the other I'm not sure of. Open to reasonable offers. Prefer a pickup since it would take a while to disassemble and package for shipment.

All equipment located in southern NH; I would be glad to show it if you're in the area. Prices plus shipping.

Phil Barber

2235. TRADE--FT-890 at for ICOM 706, or FT-900at

I have a Yaesu FT 890 at works great, unfortuantly I have a small car and nowhere to mount the thing, looking for trades only for either the ICOM 706, 706mkII or FT-900

Thanks,
Greg, N8PPZ

2236. INFO: ICOM 706 MK II Voltage Reg/Supply Problems?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-05 00:00:00 UTC
From: ve7vdx@dowco.com
Message-ID: <ve7vdx-0511972105420001@cqt-pm2-060.dowco.com>
Source record: 162567

I have heard of a problem with the IC-706 MK II where in the scaleing down in size of the voltage regulator/supply circuit causes an overheating problem. An importer I know who brings them into Vancouver from Japan told me he has sent back 13 for a refund because as he put it he believes that ICOM should make a factory mod to take care of this problem.

Furthermore I have heard that there is a dealer-mod to take care of this problem but will only be done on a complaint basis and not as a matter of course by the selling dealers.

Thanks in advance to anyone who has experience with this problem please for shareing it with me and the rest of the Newsgroup.

(please reply via email as well as the newsgroup to assure that I receive your message. tnx)

2237. Opinions wanted: Mobile dual banders with remote head?

>Timewave 599 PLUS, DSP unit. Considering using it with my TS-940S.

I purchased one new to use with my TS-940 on a Friday, and took it back on Monday, HRO, always friendly and helpful, charged a restocking fee, but it was still worth it in my view. The '940 has decent filtering on its own, and I found DSP of no additional helpfulness. I operate CW almost exclusively.

Source record: 162624

I have acquired some military DC power supplies. But I don't have any manuals,
and I'm not sure about some of the connectors, etc. They're labelled "acdc electronics inc", model TR202-1, 5 V, +15V, -15V, 115/230VAC. They have two terminal screw blocks. I don't understand what the terminals labeled with "SEN"
are for. Block one (six screws) is labeled:
1 AC-LINE
2 AC-NEUT
3 5V OUT \
4 + SEN |> A
5 - SEN |
6 5V RET /
Block 2 (eight screws) is labeled:
1 POS OUT \
2 POS SEN |
3 COM SEN |> B
4 COM OUT /
5 COM OUT \
6 COM SEN |
7 NEG SEN |> C
8 NEG OUT /

These units are about 3.25 H X 10 W X 5 D (inches). Anybody familiar with them,
or know where I can search for more info and specs, etc???

Thanks in advance for any leads! - Tom Gootee (tomg@fullnet.com)

Hi Cole and Kathy,
Yes there is a difference. If you are considering using ctcss on your machine, and it is for general amateur consumption, then the only item to use would be a conventional "PL" board. The use of a ''DPL" board would all but eliminate the use of your repeater by most individuals. There are 1000 positive and 1000 negative going "DPL" codes to choose from. Some of the newer ham rigs now are equiped with "DPL." If you don't have a real "lid" problem then your best bet is going to be the use of the former.

Actually, there is no exam needed to buy a VX-1R. His bigger problem is that the Family Radio
Service does not operate anywhere in the "465.xxx" Mhz of frequency.

Hi Shintani-san,
The new Alinco was at JAIA HARUMI this year,
though it was a working model
and not an official production unit.

Thanks for correction on the ceramic filter -- that's what
I meant, not crystal filter. I've had good luck with the
Alinco -- both fixed and portable operation -- it is not
bad as a CW radio. It's too bad the DX77 (new one) does
not offer optional filters (seemed to be audio filtering
only, but that's just from the print-ad...hope they at least
have the 1.0 Khz Murata ceramic filter installed).

I did not see the new radio in this month CQ HAM RADIO
either, but LET'S HAMMING has a picture of it in the
"atarashi musen" section.

You did not say what radio you will willing to trade for.
I have a 733 in mint condition if you want to trade. I will pay both our shipping and throw in $100.
Email me direct. tnic@idt.net

Thank you for your in depth analisys :-) Sounds like you did Zero research before you bought.

Both my TM-V7s are as solid as a rock. They operate very reliably with no problems. I for on think its the best mobile rig available today.
You can operate the entire radio with the mike. The display looks great.
Its a great performer.

I owned a 733 also. Kenwood addressed almost all the failings of that radio in the TM-V7. The 733 had tiny buttons that were hard to push.
The screen messages were so small you could crash trying to read them.
And above all the programming really sucked. It was impossible to use without the manual.

The TMV7 has ALPHA memory tags, large button easy to read screen and the programming is a dream come true. I can read the screen from a distance while driving. The letters are much larger.

I agree visual scann is a waste. But guess what - most of the radios made by other companies in this price range have it.

Feedback is most likley an installation problem. Not a radio problem.

Brett <bln@inquo.net> wrote:
: Has anyone had problems with the Kenwood TM-V7A. I purchased it at
: the Dayton Hamfest in 97, and it is the worst radio I have ever
: owned! When I transmit on 400MHz I get feed Back on the 100MHz side.
: Also for some dumb reason they (Kenwood) did away with the mute
: function. This was one of the best functions of the TM-733 (of which
: I own 2). They added this new feature called Visual Band Scan
: (Great), I think I used it for about 3 min and then got board....
: All in all stay away from this radio.... Anybody want to trade???

> Paddle?

Larry Stamm (28 Topton Road, Kutztown, PA 19530) makes beautiful plastic
dust covers for many cw paddles (including Bencher), with your callsign
neatly
engraved on the top. The engraving is done from the inside, so it's extra
nice. At $14 shipped, it's a steal. Give him a try.

Disclaimer: I have no connection with Larry, just a satisfied customer.

Are they probably "remote sense" terminals, for voltage regulation? Should
I tie
them to the output terminals, if so (or, I guess, the input terminals of
the load)?

I am getting ready to power one and test it. I don't have any idea of the
current limits
of the 5, +15, and -15 vdc outputs. Does anyone know the "best" way to
determine
them? All I've got are DMMs, scopes, and power supplies (and lots of
components).

By the way, there's also a tied-on label that has "AN/WQC-5" and
"4A1 Power Supply" and "Aug 1985" on it (although they look brand new and
were listed by the miltary as being in "A5" condition).

Thanks for any help you can give!

2268. ICOM 2710H Mic Extension Cable

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-05 00:00:00 UTC
From: "J. Dirk Bremer" <dirkb@myself.com>
Message-ID: <34608FD2.A588FC0A@myself.com>
Source record: 162643

ICOM wants about $50.00 for a microphone extension cable
when remotely mounting a 2710H in a vehicle. The microphone
cable is terminated with what looks exactly like a telco
RJ45 connector, with all 8 wires used and straight through.
I would like advice on finding someone who could fabricate
about 15 feet of 8 conductor telco or networking wire
(twisted pair) with a male RJ45 on one end and a female or
some kind of coupling connected for RJ45s on the other end.
Please advise.

Best Regards,

Dirk Bremer

Hi Again,
Thanks all for replying to my post. I am glad to see there are still people out there who care about total strangers.
I really wasn't thinking of the legal side obviously, I am just a lowly engineering student. But there must be a way for honest people to communicate about the dishonest.
Paul sent me a good idea, Simply make a page that states that :
(? Person1@???.????) has had a questionable transaction with (? Person2@???.????) E-mail (? Person2@???.????) for details.
Would everyone agree that this type of page would make no claims about anyone, but instead place the responsibility of passing misinformation on to the accuser...???
The type of page I originally thought of could easily be used to bash innocent people, but would one like Paul suggested be ethical?
I know it is a controversial idea and you are all right... I need food and shelter more than a "hopefully helpful" web page.....8)

2274. Bandbass filter for UHF and VHF?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-05 00:00:00 UTC
From: bradm@objectint.com
Message-ID: <878760527.29162@dejanews.com>
Source record: 162649

I have three off-air TV antennas installed in the attic of my house and
I'm trying to acomplish the following:

Antenna #1: UHF - Receiving Channels 17, 22 and 50
Antenna #2: VHF - Receiving Channel 5 Only
Antenna #3: VHF - Receiving Channels 4 and 11

I want to combine all three antenna's onto one single line, however I want
to first filter certain channels so that I don't end up with multiple
signals and ghosts once I combine all three antennas.

For example, I'd like to filter all VHF channels from Antenna #1, I'd
like to filter Channels 4 and 11 only from Antenna #2 and I'd like to
filter Channel 5 from Antenna #3. Can someone direct me to a distributor
or manufacturer who makes bandpass passive filters that might be designed
to do what I'm describing?

Thanks in Advance!!!

Message-ID: <01bceb02$58371c80$e5ad96ce@hp-customer>
Source record: 162521

THANKS to all who responded about the SENse inputs!

These little power supplies are GREAT. I've had one on all day, and it hasn't
varied AT ALL from 15.00 volts on my DMM, from a few minutes after it was powered on until now (about nine hours). I'm about to test the current limits.
I couldn't find any specs on this P.S., and I couldn't seem to be able to find
out anything about the power devices that are mounted on the front panel. They look like metal power FETs, and are labeled: 4-031-034 RCA SHP 8110,
for the two 15V outputs, and 4-031-033 RCA SH G 8110, and 4-031-016 RCA SHT 8046 (larger than the other three). Are these actually UJTs (saw the "SH")?
Does anybody have any specs on these, or know an equivalent, etc?? Or are they OEM and untraceable?

And, finally, since I bought a FEW more of these than I can use, I'd LOVE opinions on
what they're worth, as I plan to try to sell the surplus. They cost about $364, when
they were new, around 1985, if purchased in a large quantity. They are, and look,
unused. They came packed in foam, two per quadruple-latched plastic tub/case.
I'd REALLY appreciate some help here, guys (and gals, if there are any that can stand
to be around us!), with a valuation AND with possible targeting information for my
marketing effort! Needless to say, if anyone lurking is interested, stay tuned.
P.S. I have a jpeg I can email, if anyone want to see a picture...

No problem at all. The FT-50 will not attempt to charge the AA battery
pack; the pack lacks the charging contact that the NiCd packs have.

I can't believe that this tread is still getting attention! My original posting is from Oct. 3rd... FYI, I found a source for these resistors! In fact I found many sources at prices that ranged from $0.13 to $105 each. You can guess where my money went! I can't give details but it should prove helpful if I say that I am working with large ionic charges and the wattage requirement was basically for physical size since as everyone was quick to point out, 1 T Ohm and 3 watts would seem an impossible or at least impractical combo. Thanks for the many thoughts and I hope everyone has enjoyed the wide range of responses.

Yeah, I have the electrician I just hired downstairs wiring in the new 80 amp 220 line ;)

The way I figure it, I'll only need to drive it with about 6 watts from my FT-900 for legal limit... and if the lights in the neighborhood start dimming..... hey, dont look here!

>have ce-3, and am wondering how it can be used successfully used to
>make freq measurements in the 440 ham band around 416mhz.

It can't. That's why you want to find a CE-5 if you are going to do much
420-450 MHz work.

Good luck.

2315. SWAP LARGE EIMAC PA TUBES FOR 2M RIG

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-06 00:00:00 UTC
From: bbutler@awod.com
Message-ID: <34611c02.14593163@news-2.awod.com>
Source record: 162537

Will swap 2 full-power Eimac 4CX1500b (8660) PA tubes for clean,
working 2M mobile rig similar to the HTX-242. These are military
"pulls" and have lots of life left in them.

73,

Butch

2316. Azden PCS-3000 Question

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-06 00:00:00 UTC
From: Clete <Cletus@vabch.com.HAM>
Message-ID: <01bcea4f$ce531a80$629960d1@Cletus>
Source record: 162573

Just today I purchased an Azden PCS-3000 2m radio (circa 1977) but it has
TOO many buttons and NO manual!

Any help anyone could offer on the function of the radio would be
greatly appreciated. Especially help with the 'Offset/Scan' knob
just above the mic connector.

Thank you in advance

>12 volts. However, the label on the battery (model
>BP173) says it is a 9.6 volt battery. What's going
>on here?

This is normal. A fully charged NiCad cell has a terminal
voltage of 1.2 volts, but just after recharging it will have
a "surface charge" voltage of about 1.4 volts. This very
quickly drops to the full charge voltage after a load is
applied.

Anyway, your pack has 8 of these cells. 8*1.2=9.6 volts.
But right after charging it will be 8*1.4=11.2 volts. The
precise surface charge voltage can vary a little from 1.4
volts, and the accuracy of the radio's voltage monitor can
vary a bit as well, so seeing 12 volts on the display is
within the range of expected behavior.

>with "SEN" are for.

They are for remote sensing the voltage at the terminals of the equipment
being supplied power. For long cable runs, and high currents, there can be
a significant voltage drop in the cable. To compensate for this, you can run
a set of sense wires (don't have to be heavy because they carry very little
current) to sense the voltage at the far end of the cable. This then tells the
regulator in the power supply to boost voltage until the voltage being sensed
at the far end of the cable is the correct value.

If you don't need remote sensing, then you must strap the sense terminals
to their respective voltage output terminals on the supply. That lets it behave
as a normal regulated power supply.

Well everyone has convinced me that this type of page would be bad.
They are all right, it would be. As everyone has pointed out it would put me at serious legal risk eventhough I would not be personally making the claims.

The more I thought about it,the page could still also become a bashing page for innocent people who perhaps had not swindled anyone but rather just made somebody mad.

Jason, N1RWY had the best idea. Educate all those considering buying from a stranger over the internet to do a dejanews search for the individual in question. If bad posts are found then "Buyer Beware."

Also all the responses I have gotten has convinced me that a swindle only seems to occur for every few hundred or more transactions. So I am glad everyone let me know I was feeling too paranoid.

It would be good to see people post "Thank You's" after a good transaction to let us all know the word isnt so bad all the time.....
I still feel bad for those who get shafted.

Thanks all for the advice!

I'm posting this for my friends at Alpha...
please respond directly to them:

SAVE! ** ALPHA "SUNSPOT" SALE! ** SAVE!

Long after sunset Saturday night, I switched on
the xcvr & ALPHA. Before you could say "propagation",
two 9n1's, an AP2, and a string of Siberians were
in the log. Signal reports ran to S9+20 just like
old times. Sunspots are back!

Dave AA0RS/G3SZA, Brad K0HM, and I all love DXing,
so ALPHA/POWER is throwing a SUNSPOT SALE to celebrate
long nights with 20 wide open to everywhere all night!

CALL NOW and buy a brand new ALPHA 87A for $5,995, an
'89 for $3,795, or a '91B for $2,695. Standard warranty
and 30 day money-back guarantee, of course. Quantities
are limited, so call Dave, Brad, Barbara, or Scott and
mention that you saw this promotion to save on your new
ALPHA. Sale ends 12/19/97 in any case.

2330. Re: Opinions wanted: Mobile dual banders with remote head?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-06 00:00:00 UTC
From: "Chad Johnston, KI8CU" <webmaster@nuwaysupply.com>
Message-ID: <63sffv$4t9$1@newsserv.freeway.net>
Source record: 162587

I've got a friend who liked my cross-banding setup (with my HT and mobile) so he decided to order himself up a dual-band mobile, too. I've got the Icom IC-2350H. I've added the DTMF decoder and the CTCSS decode options.

Here's what the IC-2350H offers that my friend's Yaesu FT-5100 doesn't:

REMOTE CONTROL of my 2350 via my HT (change memory channels, direct freq. entry in VFO, change power levels, enable/disable cross-band repeat, etc.)

Auto Power OFF after 30min, 1hr, or 2hrs.

A cooling fan that operated when the transmitter is in use, not just when it starts to get too hot. The 5100 really runs hotter than my 5100, and will konk out after extended use compared to the 2350H.

Variable RF attenuators for each band (this keeps garbage from keying up the rig if you leave it in cross-band repeat without PL on either band.

Independent vol/squelch/tuning knobs for VHF and UHF.

Well, my friend bought the FT-5100, and immediately (within the first 20 minutes) wished he would have purchased the Icom instead. I make tremendous use of the remote control option, so the Icom is the way to go. I don't have any experience with the "Cool Blue" Kenwood V7A, so I can't give you any low-downs on that, but I like the Icom dual-banders better than the Yaesu ones. MY DREAM DUAL-BANDER WOULD BE THE IC-2710H. I think you can get that from AES or HRO right now for just over $500.00. A fantastic buy for a fantastic radio (the 2710H has the remote mountable face).

Just my $0.02 worth!
Chad, KI8CU

2334. Should I keep Yaesu 902DM or Buy Smaller Rig?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-06 00:00:00 UTC
From: jknoll@visi.com
Message-ID: <63sl96$7cg$1@darla.visi.com>
Source record: 162591

Hi,

I'm looking for a bit of advise regarding upgrading my
current rig - a Yaesu 902DM. I bought the 902 about
14 years ago and paid a whopping $1300 for it. Since that
time I have not been real active on HF and the rig, still in
very mint condition, is sitting in the basement hardly used.
Part of the reason I don't use it is because of other neat
hobbies such as computers, house repair, photography and the
list goes on. The other reason I don't use it is because
of the 'trouble' tuning the thing up for various bands, etc.
The newer rigs seem to have an auto tune solid state final
that makes switching bands and operating a dream experience.

I am considering replacing the 902 with the Icom IC-706MKII
which is about the same price as I paid many years ago for the
902. Maybe I should just live with the 902, however, I think I
will be more apt to take the 706 with me in the car, or wherever.
Maybe I already have enough to do in the car and don't need another
distraction. I don't know.

What I am really asking is has someone else faced the decision of
getting rid of a rig such as the 902 and either stuck with it or
replaced it with a more current all-solid state rig. I do hate
spending money especially if I don't have to. I am also a bit of
a cheap-skate when it comes to spending money when I don't really
have to.

So, what should I do?

Any suggestions?

Thanks,

Jim

>other with remote head?

I faced this same problem, nowhere to mount my 570T where I could see
it, so I bought the FT8500. This is a nice radio, but is a bear to reconfigure
while mobile. All the controls are in the microphone, and are not simple to
learn. Standard has a similar radio, also not simple to operate. Even its
display is in the microphone. You'd better have everything you want
preprogrammed in memories with either of these radios. (Flipping through
the memories is relatively easy with either one.) I'm satisfied with the
performance of the FT8500, and I like having the control head display
up where it is easy to see, but its control ergonomics could stand some
improvement.

One thing I highly recomend is to make sure that the microphone attaches
to the main radio body and *not* to the remote head. Otherwise, you are
limited in where you can mount the head by considerations of getting the
mic cord tangled in the vehicle controls, and you have to mount the remote
head stoutly to withstand the tugging from the mic cord.

With a radio that has the mic coming off the main unit, you can velcro
the remote head anywhere convienent to your line of sight. I made a
sheetmetal bracket that slips tightly over the lip of the dash above the
instrument cluster. I mounted the remote heads for the FT8500 and the
IC706 on this along with the head for my doppler direction finder. My
GPS mounts up there too. That puts them convienently in line of sight.

I use mic hangers on the center console to hold the mics. I have a swing arm
which pivots off the passenger seat front track mount bolts to hold the palmtop
for packet operation. The latter is intended to mount a portable CD player in
the car, but works great for holding the palmtop in a convienent place. The
scanner which feeds the doppler unit is clipped to the center console, along
with the cellular phone, using a couple of cellphone mount brackets.

Strapped *in* the passenger seat via the seatbelt and a modified infant
carrier is the laptop which I use for HF digital operation. That isn't always
there because the roof mounted HF antenna is too tall to let me enter the
parking garage at work. I only put it up on longer drives. Then I put the
laptop in too. Otherwise the laptop rides in its case behind the driver's seat.

The radio bodies are mounted under the passenger seat, and I use an
Icom remote speaker and a "pan" fader (differential wired stereo L pad)

to feed it from both radios. The speaker is mounted at the rear of the center console, tilted up toward my right ear. (in my old truck I had it mounted to the trim just behind the drivers door and right next to my left ear). That earlier mounting was pretty rough when I had a passenger because when I turned the volume up enough for the passenger to hear, it blasted my left ear something fierce. The center console mount works better.

All the antennas are roof mounted. The dualbander's antenna is center mounted forward. The 4 doppler antennas are mounted back of that, and the HF antenna brings up the rear. I did have a GPS antenna up there too, but mounting the GPS up on the dash lets its internal antenna work satisfactorily, so that antenna was removed. The cellphone's internal antenna also suffices around town, but I do have an external cell antenna with a spring loaded gutter clip that I can use in bad signal areas when travelling.

All it takes is a little thought to make everything fit in fairly unobtrusively. I can slip the bracket holding all the control heads off the dash and stow it under the driver's seat when parking in a high crime area, and pop the scanner in the glove box (the cellphone goes with me). That way, the thief attracted by all those antennas doesn't see anything when he looks inside. That seems to work. I've only had one break in, and the thief was driven away by the 130 db alarm in that case without taking anything. All I had to do was replace the broken window. (The trick to an effective car alarm is to make it so loud it is too painful to remain near the car. That literally drives the thief away, covering his ears.)

Hello! Does anyone know how or who might have the capability to program an older Motorola MCX 100, 16/32 channel VHF mobile radio? The model number is MBD43CUA7A00AK2, Options MBB434AB and MBB311AB. Any help on this would be greatly appreciated! The radio has a 16-pin(?) PROM in a socket next to a 40-pin microprocessor(?). The socket is labeled "PROM" or "CODEPLUG". Thanks in advance and 73, Steve KC6IJM. (seleong@gte.net).

Hi

I presently run a packet switch node using a KPC4 connected to a notebook PC (which has just 1 serial port). The computer is running the BPQ software. Port 1 is 144.900 the other is 70.325.

This is what I want to do!

I wish to add a KPC9612 to the system. This would allow me to add an additional 2 ports one of which would be 9600 baud.

Can this be done bearing in mind that I only have one serial port!

Regards

John

2356. Portable SSB reception?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-06 00:00:00 UTC
From: burati@apollo.hp.com
Message-ID: <63tcunlik1@hpwhey.ch.apollo.hp.com>
Source record: 162613
Cross-posted to: rec.boats.cruising,rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.shortwave

Extremely sorry for the crosspost, but to make the most of any answer I get I'd have to act in the next couple of days...

I have some friends sailing back across the Atlantic from the Med (in Gibraltar now waiting for a weather window to get to the Canaries).

On the way from Boston to the Med a year or so ago, they kept in touch with Herb in Canada (at 12359?) via their SSB, to get weather reports, give him a position and conditions..., and that worked most of the way to the Med. They plan on doing the same on their way back across (although a little farther from here, on their way to the Caribbean). I believe Herb is on the air around 3pm EST.

If I had a portable SSB receiver (eg, Grundig YB400), would I be able to pick up any of their conversation (at least Herb's) 25miles NW of Boston MA? I've heard that these small portables can't be used with large external antennas because they'd just be overloaded with local signals... Is it worth my spending the $$ (200?) on something like a YB400 to try and listen in on cruising boats from an inland location or would I just be wasting my money?

Please reply via email as they leave soon and I can't keep up with newsgroups these days...

Thanks in advance,
..Mike

Message-ID: <63tauv$a29@top.mitre.org>
Source record: 162614
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

For sale:

Yaesu FT-990 HF transceiver. AC/DC model; has internal AC supply, and a DC input jack; the best of both worlds. Includes DC power plug (a little hard to find). TCXO-2 temperature compensated master oscillator option installed. Has all filters including optional ones: 2.4 KHz, 2.0 KHz, 500 Hz, 250 Hz. Manual also included. Original box.

MD1-C8 desk mic with dust cover. Standard hand mic also included.

SP-6 desk speaker with LL-5 phone patch installed.

Everything works perfectly; no problems of any kind. The rig itself is in near-mint condition, at least a 9.5 (out of 10). The MD1 mic is in like-new condition. The desk speaker would also be a 9.5 except for some fairly noticable scratches on the right side of the cabinet; the front, top and other side of the cabinet are virtually perfect.

I'm asking $1595 for the entire setup (plus shipping from the DC area). Will consider an excellent HQ-170 receiver and/or Johnson Viking Ranger transmitter (I or II) in partial trade. Email if interested. Thanks.

2358. TRADE: My IC-R7000 for your HP8640B?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-06 00:00:00 UTC
From: John Miles <jmiles@pop.removethistomailme.net>
Message-ID: <34622D16.4E08@pop.removethistomailme.net>
Source record: 162615

Kind of a long shot, but... anyone interested in swapping an HP8640B (civilian model with PLL stabilization) signal generator for an unblocked Icom IC-R7000 receiver?

The R7000 in question is in excellent condition, no scratches/smoke/problems, and tunes 25 MHz - 2 GHz with full 800 MHz coverage. It is complete with original box, manual, and RC-12 remote control option.

I recently picked up a new general-coverage receiver in another deal, and don't need the R7000 anymore. I do need to upgrade my old HP608D signal generator to something a little more modern, and would like to swap the R7000 for a clean, fully-functional 8640B, preferably (but not necessarily) one with the 002 frequency-doubler and/or 001 audio oscillator options. Really looking for civilian model 8640B only, not interested in 1/2-ton bright-yellow military model unless it is literally in brand new/unused condition.

Any takers?

2359. HTX-404 receive sensitivity question

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-06 00:00:00 UTC
From: Kevin Short <kevin@larson.com>
Message-ID: <Pine.SCO.3.95.971106133246.23579A-100000@ltiadm.larson.com>
Source record: 162616

Here is the background. I purchased a second HTX-404 { close out price, what a deal} as a spare. Comparing sensitivity of both units to a weak signal it seems that that the new one is less sensitive. I used the the bar graph signal indicators to compare. Adding a 3db gain antenna to the new radio brings them both up to the same relative reading. This leads me to the deduction that the new HT is about 2 to 3 db down from my old one. I spent some time with a magnifying glass checking out the schematic and it seems to me that the only tweekable place to correct the problem on this radio would be the IF transformer. Perhaps the IF transformer is not peaked? Is this a good assumption or is it more probable the factory changed the gain structure of the first RF amp stage.

Hello All:

I do not recommend the above!

I am so tired of everybody slamming the RAM card in ICOM radio's. I have
been repairing ICOM's since the RAM card was first used. I have 2
radio's that use it, for 14 years now, still no problems. When the RAm
card came out NOBODY could offer the features at the price at that time!

If you are worried, take a DMM, carefully measure the battery voltage, if
it is above 3v, STOP! you have nothing to worry about. Yes the cards do
fail very great once in awhile, but it is very rare. More common when
someone tries to replace the battery in the field.

Yes, it can be done, but one little mistake or static surge to the card,
and call ICOM for a new one. It is just not worth worring about.

If the card does fail order a new one, there cheaper than buying extra memories you probably won't use or sending the radio to ICOM, it unplugs, and the new one plugs in. How easy.

Your NEW radio's use the same battery, what are you supposed to do when it dies in 5 years! send the whole radio in. for a battery, at $75 hour 1 hr min. NO THANK YOU.

For those of you who have the RAM CARD, don't worry and enjoy your fine ICOM radio!

I welcome responses

Scott Malcom

Hello!

I was told that there was a way to convert a Motorola VHF Maxtrac 16 mode mobile into a 32 mode model. Is it possible with the standard RSS or is there another program modfification required (or even a hardware mod?)? Thanks very much in advance for your help!

Just go ahead and use it and don't even think about the different
impeadance. The only problem will be attaching connectors. A lot of
that stuff won't take solder.

I use Rg-6 here for all my g5rv applications-- it works quite well, remember
it can't take the power rg-8 would but other than that use it.
also you do have to be creative with the connectors because the sheild is
aluminum.

Should not be a problem for HF. I have used 75 ohm feed line several
times. Of corse I also use an older rig that has tube finals and has to
be tuned(gasp). I, personaly, would not use it for vhf but it would
probably be ok. The problem I have is geting connectors to solder to
it. If any one has a sugestion let me know.

Hi Bob,
I think a large percentage of 820s's had the same problem. I had one several years ago that did exactly what you describe. I also tried the connector cleaning to no avail. What worked was: I removed the display driver pc board and carefully re-soldered EVERY connection. The job took about an hour. Never had a problem after that. (watch out for solder bridges when re-soldering)

Help,

I got the information regarding how to change the .rdf files at location 05E3 to 06 for freeband modifications. I changed it with a hex editor and downloaded it to the radio. I then tried to program the 8xx frequencies and got beeps, would not accept frequency. I then tried to scan from an 82x memory, within the valid range. It skipped the forbidden zone. I then changed the .tpl file that I made origionally. After making a backup copy of course. When I tried to download it, I got an CERR error. What did I do wrong. Radio has no hardware mods. I saw the e-mail from a recent post regarding the hex change and thought Gee if this works, that would be great.

Can anybody tell me what I am doing wrong?

Please reply either direct or to the group.

I for one ended up with a 1000' spool of RG6 really cheap. I think the "standard" way of doing a connector for it would be to do a crimp-on F connector. They are readily available as RG6 is still a major standard in the world of Cable TV. You can get adapters from F to other common types of connectors (SO239, etc.) An alternative might be to use a PL259 with the UG(75?) reducer/adapter commonly used with RG8X. I think the OD on 8X and RG6 are about the same, and mechanically it should work.

I used the acc plug on the back of my 735 to hook up a PK232. It
worked just fine like that. But if I left the plug in the acc jack and
try to use voice I would get reports of distorted audio. This would
not change if I unplugged the tnc cable from the tnc. I would have to
unplug the cable from the radio before going to voice.

I've been working with the new AMDS-1D software for the VX-1 for several hours, and have read every word of the help file. I cannot find any indication that memories from different bands can be programmed into a single bank, as we were lead to believe by someone who talked with the folks at RT Systems. (For example, you cannot program a VHF frequency into the U-HAM band). Apparently, the software does not allow you do do anything "extra" with your VX-1 that you cannot do manually.Have others found this to be true, or am I missing something?

Hello David:

Sorry, I didn't see the price and location on your post
when I replied before.

I am VERY interested in this unit. Do you have any
pictures of the front panel that you could mail or fax.
Is this mfg. by RHODE & SCHWARTZ?

Do you know the age (eg mfg. date) of the unit?

Do you have manuals in English (German?) ?

The TS 180 looks great, has narrow CW and SSB filter, loaded, 12VDC , was just before the 930, sort of a mobile 930. $500 and I ship and insure it to your door. The 530S is the 830 without a few bells, in top shape with CW filter anc MC 50 mic. $500 and I ship and insure it to you, Lower 48 of course. Close outs, hamfest season is over!! Will trade towards medium sized amp and also need 6 meter module for 767. Thanks Murray

Bob,
There are several Service Bulletins regarding the TS-820S DG-1 on the Kenwood website (http://www.kenwood.net). Go to their archives and search for "DG-1" (or just download the text index and get the ones you need. You download from their FTP site.)
Mostly they agree blame dirty connector contacts and bad solder joints. But, as K0PW said, we've ALL had problems with 'em.
Good luck & 73,
George, K2RXY/7

2390. Automatically search newsgroups - 218 1107165427 LHK

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-07 00:00:00 UTC
From: 381@863.com
Message-ID: <640a0c$kij@news2.triton.net>
Source record: 162447

Automate your collecting research!

News Rover is the ideal tool for searching through Usenet newsgroups for messages about items that you collect. Once you tell it what to look for, News Rover will scan a set of newsgroups and collect all messages that contain what you are searching for. For example, if you are interested in messages related to slide rules or calculators, you could specify a search expression such as:

slide rule or calculator

News Rover will then scan a set of newsgroups you select and collect any messages that match the search expression. This searching is completely automatic, so it works while you sleep, work, or play. The search expressions can be as simple as a single word, or they can be complex expressions with AND, OR, NEAR, and NOT operators.

You can download a free demonstration copy of News Rover from:

http://www.NewsRover.com

But News Rover is good for more than just searching collectables newsgroups. You can use it to search for family names in genealogy newsgroups, or for any other type of information in any newsgroups you choose. And News Rover is ideal for picture newsgroups. It decodes both UUencoded and MIME base64 images, and it combines and reconstructs binary files that are split into multiple messages.

Here are some of the key features of News Rover:

o Scans newsgroups you specify while you sleep, work, and play.

o Automatically downloads messages and attached files so that they are available for instant access when you are ready to review them.

o Decodes attached files of all types (UUencoded and MIME base64).

o Displays a picture gallery of collected thumbnail size images.

o Selects messages based on include and/or exclude criteria to help you find a needle in a haystack and eliminate spam. You can even use complex selection expressions with AND, OR, NEAR and NOT.

o Supports multiple "interest groups," each with sets of newsgroups, selection expressions, message database, and picture gallery.

o Remembers files already extracted and eliminates duplicates automatically.

o Saves parts of multi-part files, searches for the missing parts, and rebuilds the entire file when the last part arrives. It even combines parts found on different days and in different newsgroups.

o Allows you to post Usenet messages and send e-mail messages.

o Allows you to block all future messages from specified senders.

o Operates on a schedule you set up to use your phone line only when you don't need it.

o Automatically dials the provider and hangs up the phone when it is finished.

o Works with almost all Internet providers and news servers.

o News Rover is multi-threaded so you can read messages and view pictures while it downloads and decodes more messages.

News Rover was designed and written by real-life Usnet newsgroup junkies! With News Rover the news is ready when you are!

To learn more and download your free demonstration copy, visit:

http://www.NewsRover.com

News Rover is getting rave reviews...

D.G. says: I downloaded News Rover last night... I ordered this morning. I don't know how much time I saved. I give your product two thumbs up!!!

T.B. says: "Great Job!!! I tried your software for the first time today, and it beats Plukit-32 hands down!!

Caveat/disclaimer: Don't blame me if you wreck your radio or void your
warranty attempting any of this :-).

The combination of people on the radio telling me I was scratchier than
usual and my noticing that my antenna was wobbling around inspired me to try
to tighten up the antenna connector (BNC). Here's what I found...

I opened up the two halves of the case, as described in all the mod docs.
Note that the screw under the mike/speaker jack cover is different from the
others, and may require a different screwdriver (with thinner "blades").
Also note that there is a tongue-and-groove arrangement on both sides of
the battery compartment that you'll need to pop open gently. As explained
below, *don't* attempt to slide the two halves of the case apart to open
it up.

Upon opening the case into its two halves, I found that the BNC is _not_
attached to the same half of the case that the circuit board is attached
to, leading to the weirdness that I found below.

I found that there is a heavily tinned wire coming out of the BNC which has
a right angle in it. It doesn't appear to be flexible at all, which is
good, as you'll see below.

The weird thing is that the other end of this wire isn't soldered to the circuit board. If it was, you wouldn't be able to open the case without breaking the wire off of the circuit board :-(. Instead, apparently the wire just rests against a tiny(!) contact pad on the circuit board. Very(!) near to the contact pad is a equally tiny surface mount device of some kind, and the legs of an IC.

So imagine that you've got this (enormous, relatively speaking) wire finger sticking out and down from the back of the BNC connector, leading down to touch the surface of the circuit board, just between the tiny surface mount device and the IC legs. If that wire finger was able to wiggle the least little bit (we're talking <2mm here), it would intermittently short to either the neighboring surface mount device or to one of the IC's legs, rather than connect to the tiny contact pad that it's supposed to be touching :-(.

And the bad news is, if you let it get bad enough, this is exactly what happens when the antenna connector comes loose :-(:-(:-(. So hopefully now you'll be interested in reading about my experience in tightening it up :-).

Ok, so you've gingerly opened the case, and find the two halves are connected by a ribbon cable and 3 wires that are tied together. There's not quite enough slack in the cables to lay the halves of the case flat, so be careful you don't accidentally rip them out by the roots :-(.

You'll be able to see the bottoms (threads) of the two screws that hold down the antenna connector, but the heads are under a piece of plastic that surrounds the antenna connector and wraps around the top/back of the radio.

To remove this plastic, first remove the antenna from the radio, and throw it in the trash can (just kidding) :-). You'll see that the plastic is held down by a thin piece of foam rubber that's stuck to it and to one of the metal RF shields. Very gently peel the foam rubber off the plastic piece you're trying to remove. It's really easy to tear it, so work slowly.

Once you've got the foam rubber off, you can wiggle the plastic piece off, but you'll find that you need to remove the rubber O-ring from around the antenna connector first. Do that, then the plastic piece should come off easily, exposing the screws that need to be tightened.

Once you tighten the antenna connector screws, just reverse your procedure, and hopefully your radio will still work :-). Caveat: Remember the "wire finger" sticking out of the back of the antenna connector? Make d*mn sure that when you put the two halves of the case back together that you get them lined up perfectly (<2mm slop, remember?) before you try to do the final closure. Otherwise you risk getting that wire finger hung up on that tiny surface mount component or the IC's legs that I wrote about above.

Have fun, and let me know how it goes,
--

Kenwood TH79 Dual Bander Modification and Feature Guide r1.5 9/13/94
==========
Clayton Wagar, KD4IDN
920 West Crawford Street #7
Dalton, GA 30720

Here is a compiled list of modifications and features I've found for the
Kenwood TH79 Dual Band HT.

Thanks to the following for their contributions to this document:
Mike Musick, N0QBF
Cole Cunningham, AA7RD
Duane Voth, KC5BGV
Chuck Scott, N8DNX

Having had many other radios in the past, and certain to have many in
the future, I understand the anticipation of Amateur Radio operators to
find modifications to their equipment. I started this document because I
want to see _quality_ information circulated as quickly as possible, in
order to save a lot of time and effort for others.

If you have any other comments, mods, or information you would like to see
included in this document in the future, please send them to:
Clayton Wagar KD4IDN
yensid1@aol.com

Outstanding questions at the time this document was released:

* Rumor of a keypad modification to the radio for "Wide band" TX, RX. If you
know of this mod, please write to me, even if you wish it not to be
published. This would save a number of poor radios from useless torture!

Hope you find all of this information useful. Again, please send corrections
or additions to yensid1@aol.com

VIII. Other Stuff

++
I. Disclaimer
++

Well, don't you get sick of this stuff? I know, I know. However, I must say that I cannot and will not be responsible for anything that might happen to your radio, your person, your dog, or other operators you might talk to with your th79. In addition, if you decide that, with your newly modified HT, you just absolutely must cause unlawful interference with another ham or another radio service, I won't pay your NAL. Really.

Oh, and while we're at it... The extended RX/TX modifications may require you to solder or desolder really, really small components. If you want to know how small, look at the tip of an average ball point pen. Smaller than that. It takes about 1/2 of a second to wipe out several components as well as fry the board inside the 79. Please be careful.

++
II. TH79 Description and Impressions, by Mike Musick, N0QBF
++

Lulled by the sexy small size, I succumbed (or, rather, the credit card succumbed) and bought a Kenwood TH-79 dual-band H-T recently. Already owning a TH-78, the comparison comes easy.

SPECS. The TH-79A is a U.S.-spec dual-band transceiver, featuring coverage from 144-148 and 438-450 MHz. Receive coverage is extended on the 2M side from 118 to 174 MHz with AM in the aircraft band; there is no extended UHF coverage without modification. Max power is rated 5W on VHF and 3.5W on UHF with a 12V source; max power with stock 600 mAH nicad pack is 2.5/2.0. There are three power levels for each band - high, low, and extra-low (30mW). There are 80 memory channels, with no evident expansion capability. U.S./Canada version comes with the CTCSS encode/decode option. Going price at a 7/17/94 hamfest was $480.

GENERAL IMPRESSIONS. Tiny, tiny, tiny. Imagine putting a small duckie on the ARRL Repeater Directory - except that the 79 is narrower by about an inch. With the standard battery and not counting the belt clip, the dimensions are roughly 2" wide, 5"

tall, and 1" thick. The belt clip adds 3/8" to the thickness; I left it off so it would be pocketable, and, frankly, it fits moderately comfortably in my work slacks' front pockets, which was surprising. It's tiny! (Oh, I said that already.)

The 79's keyboard has larger buttons than it's predecessor (lacks the cover, too) which are much easier to use. Control layout in general is better and even in just a couple of days I appreciated the change. No more ambiguous power switch - it's in the primary band volume knob in a normal OFF/ON/VOL setup. Secondary band volume control is on the "ring" of the freq/channel encoder knob in a coaxial arrangement.

There are no squelch knobs; it a key+knob function for both bands. Squelch control was, well, interesting. There are only six "settings", with usually only the lowest setting opening the squelch under no signal. Reading between the lines in the manual, apparently the squelch circuit is semi-automatic. I expected some limitations, but had no complaints under actual use - it worked well.

With my expected habit of putting it in my pocket, I like the control lock switch - it's *not* an F-key function, but, rather is a slide switch next to the PTT. No more fumbling around to unlock it. Unfortunately, the lock function does not lock PTT - that has to be disabled with the "Tx Stop" menu setting. I found this out the hard way by putting it in my pocket and inadvertently keying-up a repeater.

The 79 has an alphanumeric display capability of two lines of 10 characters, which is used in several ways. First, there is a "guide" facility, which provides online instruction for most operation features with a scrolling display. Then there is a "menu" function, which provides access to the settings which were normally done with obscure F-key commands in the 78. Setting the various functions is very clear this way. There is also a status review mode, where the more important settings are displayed.

Finally, the alphanumeric display can be set for each programmed channel. Seven characters positions are available, and almost the entire extended ANSI character set - that's right: lower case, symbols, and accented characters - can be used. However, alpha display is mutually exclusive with frequency display. Frequency display mode can be selected in case you forgot what was "underneath" your programmed channel ID.

++
III. MARS/CAP Modification provided by Mike Musick, N0QBF
++

Here is the MARS/CAP modification for the new Kenwood TH-79A dual-band HT. Usual disclaimers about doing mods apply.

1. Remove battery.

2. Open case by first removing 3 screws (#00 Phillips) on back
and 1 screw on side hidden underneath the rubber flap covering
the DC power jack. Gently pry apart starting at top; BNC
connector will move with back, knobs with front.

3. Spread unit out. Wires will "hinge" on the side with the PTT
button.

4. Looking on the back of the keypad (front) half, locate green
wire on upper left, just below the CTCSS decoder module.

5. Neatly cut this green wire, and tuck back in so ends won't
touch each other or other components.

6. Reassemble.

Programmed memory will be lost since the CPU will notice the
strap change and reset itself.

End result -

Before: VHF RX - 118.000-173.995 TX - 144.000-147.995
UHF RX - 438.000-449.995 TX - 438.000-449.995

After: VHF RX - 118.000-173.995 TX - 142.000-151.995
UHF RX - 420.000-449.995 TX - 420.000-449.995

Automatic repeater offset and shift selections remain normal.

And this tip comes from Duane Voth, KC5BGV...

"The MARS/CAP mod can be made without opening the entire case up. You
can fairly easily cut the green wire by simply (and carefully) removing
the CTCSS decoder cover and using a small pair of diagonal wire cutters."

++
IV. "Wide Band" Modification, provided by Cole Cunningham, AA7RD
++

Following is a modification for the Kenwood TH-79A Dual Band HT which
opens it up to tuning from 67-174 MHz and 400-511 MHz. Actual receive was
85-135.995 AM and 136-179.995 FM with reasonable (0.5 microvolt
or better) sensitivity at all the points I measured. Transmit was
136-179.995 and 400-511 with power dropping off at the ends but still
usable (about 0.5w on the high scale at the band edges).

As usual, I take no responsibility for the mods, or your use of the unit
after mod. Please exercise good judgement and don't endanger our ham bands
with your irresponsible actions.

The observations noted are all I tried and I have no further data.
This is such a delicate operation that one shot was all I wanted to do,
and when it worked I quit!!!

WARNING-CAUTION-LOOKOUT-ETC!!!
The diodes to be moved are microscopic!! About 1mm long by 0.5mm wide.
This mod should be done by professionals on a closed track only.
Children, do not attempt this at home. Requires extremely small soldering
tools and MUCH skill. I had a professional surface mount facility do mine...

1. Open the unit by removing three screws from the back and one under the
DC power input cover. Carefully separate the front and back pieces.
The two case halves may be disconnected by pulling the wired plug and by
prying the brown latch on the ribbon cable connector up enough to
release it.

2. On the front PC board in the lower right corner as viewed from the rear
with the knobs pointing up there are seven spots for diodes in a row,
with one diode missing.

```
|
o o o o x o o |
_______________|
2 3 4 5 6 7 8
```

The numbers are D302-D308, left to right, with D306 missing.

3. Remove D304, and D307. Put them away in a safe place (Just in case...)_

4. You should now have:

```
|
o o x o x x o |
_______________|
2 3 4 5 6 7 8
```

5. Reassemble and good Luck.

Enjoy, but don't create problems with the new capability...Wouldn't it be
nice if Kenwood would make a RX only mod with these capabilities and we
wouldn't have to worry about accidental transmissions where we shouldn't
be transmitting. I, for one, don't want or need to TX, just RX...

73, Cole, AA7RD
August 11, 1994

(Note - This mod also adds 2 more menu settings. One of which is an
AM/FM demod selector for the 300-400 Mhz band. To access this
band, select the VHF band, press F, then press the Low/Hi key.
Repeat to return to 144 Mhz. The AM/FM selector will allow you
to listen to Military transmissions in the 300Mhz band in
either AM or FM.
- Clayton)

++
V. Remote Base Operation with Kenwood 732/733
++

Kenwood has now simplified remote base operation of their mobile rigs
with the TH79.

I will not give a step by step on how to control the mobile rigs, since they are different. Hoewever, to really understand this feature, I would first get to know the remote control feature on the mobile very well. This makes the following explanation a little clearer!

To access this feature, hold [PTT] and [MR] while [POWER ON].

The display will indicate -RC-, which I presume means 'Remote Control'.

If you have correctly matched your DTSS codes, frequencies, etc, the dual bander's keypad now becomes a function pad. Pressing certain keys enables or disables functions on the mobile rig by sending the DTMF sequences for you.

Please note that all this fuction does is send the DTMF tones over the air to control your mobile rig. I have not made a list of what each key does, but as the 79 sends the DTMF tones, the display will indicate the function. (i.e. - RPT ON, RPT OFF, TONE ON, TONE OFF, etc.)

73 de Clayton
KD4IDN

And this from Chuck Scott, N8DNX...

"The "RC" function is configured to directly control radios such as the TM-732. In fact, if you look at the layout of the microphone remote commands for the 732 it very closely matches the key assignments for of the "RC" mode. Since I have a TM-732 installed in my car, I had a chance to try this out and it's VERY convenient. Everything from direct frequency entry with the "F" key to enabling X-Band repeat. I'm really surprised they aren't marketing this feature of the radio."

++
VI. Post Modification Spec Sheet, by Clayton Wagar, KD4IDN
++

Here is a small chart showing the measured specifictions of TH79 S/N 60300272 after modification. The measurements were made with an IFR 1200S Service Monitor, on the bench, with a 6V power supply. Your milage may vary - these are just what happened with mine, and I would suspect that most units are pretty similar.

73 de Clayton

++
VII. Cross Band Repeat, from Chuck Scott, N8DNX
++

The TH-79 does go into X-Band repeat. Press the "F" key then the "MONI"
key to enter repeat mode. Use the same to return to normal. There is a
10 min transmit limit so it's not useable for long duration monitoring of
a continuous transmission. That's understandable in light of the number
of horror stories I've heard of people frying their HT's in repeat mode.

++
VIII. Other Observations, Ramblings, Etc.

++

>From Chuck Scott, N8DNX....

"Regarding the lack of a memory Lock Out function, I talked at length
with the Kenwood people. They have been inundated calls about this and
have told me that they are preasuring Japan to come up with a processor
replacement to fix this, perhaps as a retrofit. I encourage any owner of
a TH-79 to write to Kenwood insisting on such a modification at no cost
and asking that they be informed when it is available. I think this is
justified for several reasons. First, I have been told by another ham
that the official brochure indicates that such a feature is included.
Second, and more important, it is arguable that the radio is not suited
to the application without memory lockout. After all, it's an 80 channel
radio. To make effective use of that many channels REQUIRES a channel
lockout function. Without effective use of that many channels, the radio
is not comparable to the current standard for such a unit.

BTW, close inspection of the RF deck in my radio shows no obvious
missing parts. I didn't remove the board to check the other side, but
my suspicion is that the 800 MHz parts are installed. I'd be interested
in input from others on that. So far I've not discovered how to make it
display any 800 MHz frequencies though."

In addition, if you decide that, with your newly modified HT, you just absolutely must cause unlawful interference with another ham or another radio service, I won't pay your NAL. Really.

Oh, and while we're at it... The extended RX/TX modifications may require you to solder or desolder really, really small components. If you want to know how small, look at the tip of an average ball point pen. Smaller than that. It takes about 1/2 of a second to wipe out several components as well as fry the board inside the 79. Please be careful.

++

II. TH79 Description and Impressions, by Mike Musick, N0QBF

++

Lulled by the sexy small size, I succumbed (or, rather, the credit card succumbed) and bought a Kenwood TH-79 dual-band H-T recently. Already owning a TH-78, the comparison comes easy.

SPECS. The TH-79A is a U.S.-spec dual-band transceiver, featuring coverage from 144-148 and 438-450 MHz. Receive coverage is extended on the 2M side from 118 to 174 MHz with AM in the aircraft band; there is no extended UHF coverage without modification. Max power is rated 5W on VHF and 3.5W on UHF with a 12V source; max power with stock 600 mAH nicad pack is 2.5/2.0. There are three power levels for each band - high, low, and extra-low (30mW). There are 80 memory channels, with no evident expansion capability. U.S./Canada version comes with the CTCSS

encode/decode option. Going price at a 7/17/94 hamfest was $480.

GENERAL IMPRESSIONS. Tiny, tiny, tiny. Imagine putting a small duckie on the ARRL Repeater Directory - except that the 79 is narrower by about an inch. With the standard battery and not counting the belt clip, the dimensions are roughly 2" wide, 5" tall, and 1" thick. The belt clip adds 3/8" to the thickness; I left it off so it would be pocketable, and, frankly, it fits moderately comfortably in my work slacks' front pockets, which was surprising. It's tiny! (Oh, I said that already.)

The 79's keyboard has larger buttons than it's predecessor (lacks the cover, too) which are much easier to use. Control layout in general is better and even in just a couple of days I appreciated the change. No more ambiguous power switch - it's in the primary band volume knob in a normal OFF/ON/VOL setup. Secondary band volume control is on the "ring" of the freq/channel encoder knob in a coaxial arrangement.

There are no squelch knobs; it a key+knob function for both bands. Squelch control was, well, interesting. There are only six "settings", with usually only the lowest setting opening the squelch under no signal. Reading between the lines in the manual, apparently the squelch circuit is semi-automatic. I expected some limitations, but had no complaints under actual use - it worked well.

With my expected habit of putting it in my pocket, I like the control lock switch - it's *not* an F-key function, but, rather is a slide switch next to the PTT. No more fumbling around to unlock it. Unfortunately, the lock function does not lock PTT - that has to be disabled with the "Tx Stop" menu setting. I found this out the hard way by putting it in my pocket and inadvertently keying-up a repeater.

The 79 has an alphanumeric display capability of two lines of 10

characters, which is used in several ways. First, there is a "guide" facility, which provides online instruction for most operation features with a scrolling display. Then there is a "menu" function, which provides access to the settings which were normally done with obscure F-key commands in the 78. Setting the various functions is very clear this way. There is also a status review mode, where the more important settings are displayed. Finally, the alphanumeric display can be set for each programmed channel. Seven characters positions are available, and almost the entire extended ANSI character set - that's right: lower case, symbols, and accented characters - can be used. However, alpha display is mutually exclusive with frequency display. Frequency display mode can be selected in case you forgot what was "underneath" your programmed channel ID.

++

III. MARS/CAP Modification provided by Mike Musick, N0QBF

++

Here is the MARS/CAP modification for the new Kenwood TH-79A dual-band HT. Usual disclaimers about doing mods apply.

1. Remove battery.

2. Open case by first removing 3 screws (#00 Phillips) on back and 1 screw on side hidden underneath the rubber flap covering the DC power jack. Gently pry apart starting at top; BNC connector will move with back, knobs with front.

3. Spread unit out. Wires will "hinge" on the side with the PTT button.

4. Looking on the back of the keypad (front) half, locate green wire on upper left, just below the CTCSS decoder module.

5. Neatly cut this green wire, and tuck back in so ends won't touch each other or other components.

6. Reassemble.

Programmed memory will be lost since the CPU will notice the

strap change and reset itself.

End result -

Before: VHF RX - 118.000-173.995 TX - 144.000-147.995

UHF RX - 438.000-449.995 TX - 438.000-449.995

After: VHF RX - 118.000-173.995 TX - 142.000-151.995

UHF RX - 420.000-449.995 TX - 420.000-449.995

Automatic repeater offset and shift selections remain normal.

And this tip comes from Duane Voth, KC5BGV...

"The MARS/CAP mod can be made without opening the entire case up. You

can fairly easily cut the green wire by simply (and carefully) removing

the CTCSS decoder cover and using a small pair of diagonal wire cutters."

++

IV. "Wide Band" Modification, provided by Cole Cunningham, AA7RD

++

Following is a modification for the Kenwood TH-79A Dual Band HT which

opens it up to tuning from 67-174 MHz and 400-511 MHz. Actual receive was

85-135.995 AM and 136-179.995 FM with reasonable (0.5 microvolt

or better) sensitivity at all the points I measured. Transmit was

136-179.995 and 400-511 with power dropping off at the ends but still

usable (about 0.5w on the high scale at the band edges).

As usual, I take no responsibility for the mods, or your use of the unit

after mod. Please exercise good judgement and don't endanger our ham bands

with your irresponsible actions.

The observations noted are all I tried and I have no further data.

This is such a delicate operation that one shot was all I wanted to do,

and when it worked I quit!!!

WARNING-CAUTION-LOOKOUT-ETC!!!

The diodes to be moved are microscopic!! About 1mm long by 0.5mm wide.

This mod should be done by professionals on a closed track only.

Children, do not attempt this at home. Requires extremely small soldering

tools and MUCH skill. I had a professional surface mount facility do mine...

1. Open the unit by removing three screws from the back and one under the
DC power input cover. Carefully separate the front and back pieces.
The two case halves may be disconnected by pulling the wired plug and by
prying the brown latch on the ribbon cable connector up enough to
release it.

2. On the front PC board in the lower right corner as viewed from the rear
with the knobs pointing up there are seven spots for diodes in a row,
with one diode missing.

```
|
o o o o x o o |
_____________|
2 3 4 5 6 7 8
```

The numbers are D302-D308, left to right, with D306 missing.

3. Remove D304, and D307. Put them away in a safe place (Just in case...)_

4. You should now have:

```
|
o o x o x x o |
_____________|
2 3 4 5 6 7 8
```

5. Reassemble and good Luck.

Enjoy, but don't create problems with the new capability...Wouldn't it be
nice if Kenwood would make a RX only mod with these capabilities and we
wouldn't have to worry about accidental transmissions where we shouldn't
be transmitting. I, for one, don't want or need to TX, just RX...

73, Cole, AA7RD

August 11, 1994

(Note - This mod also adds 2 more menu settings. One of which is an
AM/FM demod selector for the 300-400 Mhz band. To access this
band, select the VHF band, press F, then press the Low/Hi key.
Repeat to return to 144 Mhz. The AM/FM selector will allow you

to listen to Military transmissions in the 300Mhz band in

either AM or FM.

- Clayton)

++

V. Remote Base Operation with Kenwood 732/733

++

Kenwood has now simplified remote base operation of their mobile rigs

with the TH79.

I will not give a step by step on how to control the mobile rigs, since

they are different. Hoewever, to really understand this feature, I would

first get to know the remote control feature on the mobile very well. This

makes the following explanation a little clearer!

To access this feature, hold [PTT] and [MR] while [POWER ON].

The display will indicate -RC-, which I presume means 'Remote Control'.

If you have correctly matched your DTSS codes, frequencies, etc, the

dual bander's keypad now becomes a function pad. Pressing certain keys

enables or disables functions on the mobile rig by sending the DTMF

sequences for you.

Please note that all this fuction does is send the DTMF tones over the air

to control your mobile rig. I have not made a list of what each key does,

but as the 79 sends the DTMF tones, the display will indicate the function.

(i.e. - RPT ON, RPT OFF, TONE ON, TONE OFF, etc.)

73 de Clayton

KD4IDN

And this from Chuck Scott, N8DNX...

"The "RC" function is configured to directly control radios such as

the TM-732. In fact, if you look at the layout of the microphone remote

commands for the 732 it very closely matches the key assignments for of

the "RC" mode. Since I have a TM-732 installed in my car, I had a chance

to try this out and it's VERY convenient. Everything from direct frequency

entry with the "F" key to enabling X-Band repeat. I'm really surprised

they aren't marketing this feature of the radio."

++

VI. Post Modification Spec Sheet, by Clayton Wagar, KD4IDN

++

Here is a small chart showing the measured specifictions of TH79
S/N 60300272 after modification. The measurements were made with an
IFR 1200S Service Monitor, on the bench, with a 6V power supply.
Your milage may vary - these are just what happened with mine, and
I would suspect that most units are pretty similar.

73 de Clayton

++

VII. Cross Band Repeat, from Chuck Scott, N8DNX

++

The TH-79 does go into X-Band repeat. Press the "F" key then the "MONI"

key to enter repeat mode. Use the same to return to normal. There is a 10 min transmit limit so it's not useable for long duration monitoring of a continuous transmission. That's understandable in light of the number of horror stories I've heard of people frying their HT's in repeat mode.

++

VIII. Other Observations, Ramblings, Etc.

++

From Chuck Scott, N8DNX....

"Regarding the lack of a memory Lock Out function, I talked at length with the Kenwood people. They have been inundated calls about this and have told me that they are preasuring Japan to come up with a processor replacement to fix this, perhaps as a retrofit. I encourage any owner of a TH-79 to write to Kenwood insisting on such a modification at no cost and asking that they be informed when it is available. I think this is justified for several reasons. First, I have been told by another ham that the official brochure indicates that such a feature is included. Second, and more important, it is arguable that the radio is not suited to the application without memory lockout. After all, it's an 80 channel radio. To make effective use of that many channels REQUIRES a channel lockout function. Without effective use of that many channels, the radio is not comparable to the current standard for such a unit.

BTW, close inspection of the RF deck in my radio shows no obvious missing parts. I didn't remove the board to check the other side, but my suspicion is that the 800 MHz parts are installed. I'd be interested in input from others on that. So far I've not discovered how to make it display any 800 MHz frequencies though."

Source record: 162450

I found this on dejanews.
Good Luck! Trent

You need to remove a TINY resistor. Though the following mod is for the
DJ-S41, it works just fine on the DJ-S11. RX will be approx: 137-173 MHz
(off the top of my head, don't have the radio on me now). BTW I am
forwarding what was sent to me and accept no responsibility for what you
do to your own radio.Here's the mod:
Subject: EXPANDED RX / TX MOD FOR ALINCO DJ-S41
Performing this modification will void any warranties.
All standard disclaimers apply. This mod is for the
DJ-S41T, and not the DJ-S41(C) 10 mW version.
1. Place the radio face down on a soft towel. This avoids
scratching the display and gives you a place to put
the seven tiny screws to be removed. 2. Remove the batteries.
3. Remove the three screws on the upper rear cover, and
the four screws inside the battery compartment. The
rear cover can be lifted and removed easily, as there
are no wires to be concerned about. The antenna
connection is made by means of a gold-plated spring contact.
4. Look for a small (about 1 mm) green surface mount
resistor (actually a 0 ohm jumper), located on the far
left side of the exposed circuit board, located to the
"northwest" of the speaker. There is a marking in white
letters, OP/CL, this resistor is over the top of the "P".
It is the only green component visible on the board.
(This radio does not have the traditional Alinco red
and blue wires which have become so familiar...)
5. Carefully remove this resistor, using a small tip soldering
iron, tweezers and a steady hand.
6. Re-assemble the radio, being careful that the thin rubber
gasket is seated around the inside edge of the rear cover.
Replace the batteries, press and hold the "F" button on the
left side of the radio, and turn it on. The display should
show all segments and markings. Release the "F" button and
the radio will now be capable of operating from approximately
425 MHz to above 470 MHz, depending on the VCO's tuning.
The display will blink if the VCO is taken out of its range.
Re-tweeking of the VCO is not recommended.
7. Although reception on the expanded frequencies is legal,
transmission is not. This unit is not FCC type-accepted
for anything but ham band (425 - 440.995 MHz) operation.

Just found out that Icom decided to use a cheaper/smaller 5 volt regulator in the
lst 2-3
months of Ic-706 Mk II.. Yes, the old Ic-706 Mk I and early Ic-706 MkII are ok.
The problem is Icom was trying to save 50 cents on using the new cheaper and
smaller
regulators and they are burning up from the heat in the radio. Also, the new style
regulators are not properly attached to the Main Heatsink. I am not sure of the
serial # affected but If I were looking for a new radio I would want the
"RETROFIT" lit installed.
I personally will wait till after the new year for all the old units to be sold.

: Extremely sorry for the crosspost, but to make the most of any answer I

I've frequently heard marine stations on shortwave on my
Sony 2010, with a small external antenna. It depends on
propagation, though, and that's been bad and is getting
better but ... no promises. :-(

The 2010 is also a pretty good receiver, for a portable. And
no fiddling with a BFO; you punch in the frequency and punch
the USB or LSB button and you're there.

It's pricey, though, and as I said, with the vagaries of
propagation, you might or might not get them easily, or at
all. Sorry.

Good luck on whatever you decide to try.

Hi, Ron

I've been using a Starndard C5900 since last March. It's expensive (about $900 with the 400 channel memory option), but most of my hamming is mobile, and I wanted something good. This is actually a tri-band radio, with 6 meters in addition to 144 and 440.

It is a "programmers delight" - fairly complicated to configure, and you wouldn't want to make changes while driving. Intermod rejection is excellent.

If the price doesn't scare you off, check it out.

73,
Gary KN4AQ

John,
Why do you need an atu?
You'll just be heating up the components in the atu, you will not be putting any more power actually into the antenna.
And anyway, the G5RV antenna is highly overated.
What do you want from your radio that you can't get from a good vertical or a compact 3 or 4 ele yagi?

>No you don't want to do that! What happens one day if the cable from the
>battery becomes unfastened or broken? Your radio will become the path for
>all the cranking amps! Expensive ground cable!

Well, no, that's why you want to fuse the negative lead if it goes direct to the battery. If it goes to chassis instead, then loss of the battery negative connection to chassis just results in a dead vehicle and dead radio due to lack of power. It is when the radio negative substitutes for that cable that cranking amps may attempt to traverse it. Thus you need to fuse the negative to prevent this from occuring if you connect directly to the battery.

But you *do* want to wire directly to the battery negative for your radio (with a fuse) anyway because that eliminates noise pickup due to a shared return path with other electrical systems in the vehicle, IE ground loop problems. Hooking to the chassis for negative return is a bad idea from the point of view of noise reduction since that path is modulated by all vehicle electrical loads across the shared impedance of the path. Similarly, you want to take positive directly from the battery too. Don't connect downstream where it has to share a common impedance with other vehicle electrical loads, or you run into the same noise problems.

The battery acts as a very large capacitor for low frequencies, so adding a large electrolytic capacitor is generally ineffective. Use of a series choke, however, can be useful. That forms a LC lowpass filter with the battery capacitance. Shunting the choke with low value RF bypass capacitors can be helpful to suppress high order harmonics of the vehicle systems' impulse noises, IE a PI filter section.

If you follow these wiring practices and alternator noise is still present, then the most likely cause is one or more faulty diodes in the alternator. The only cure for that is to replace the alternator. I just had to do that in my truck, and all the alternator noise disappeared.

Yes it can happen! The path is from the battery negative, through the negative lead to the radio, through the coax shield, to the antenna-vehicle ground point, through the vehicle metal work back to the starter motor. Resulting minimum damage - smoked radio and antenna cables. USA A FUSE IN THE NEGATIVE LEAD TO THE RADIO!

2427. FT-50R optimum settings

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-07 00:00:00 UTC
From: Rudy Marcelletti <rudym@net-link.net>
Message-ID: <01bceb7b$0d31bf00$6ce531cf@rudym>
Source record: 162558

Does any one know what the best settings are for an FT-50R for VHF and UHF
for the following:

HSSQ
THSQ
TISQ
S1LV
S9LV
HIPO
L3PO
L2PO
L1PO

Also, are the settings radio-specific, i.e., must they be tailored to
individual radio quirks by using an analyzer or other test epqipment.

Perhaps if I get a few responses I could compare and come up with an
average setting

Thanks. Rudy, K8SWD

>-----------
>Roger Tomas
>AG Communication Systems

Gary's comments are true, but I've noticed that several W32's (mine included) seem to have "generous" voltmeters that read 1/2 to 1 volt high all the time. I can't say why, but yours seems to fit the pattern I've seen.

From: sam <sammy89@hotmail.com>
Message-ID: <34631533.59442B2E@hotmail.com>
Source record: 162560

I got three (3) messages about the same 5 volt regulator overheating!!! Two friends of mine also have just got their IC-706 MK Ii back from Icom!!!! (For the same problem). It seems Icom is covering up this problem by denying there is a problem. If you call up they will say"this is the first time I heard of this problem", RIGHT !!! If you believe that I want to sell you the Brooklyn Bridge!!

I thin Ico feels it is cheaper to repair the units that fail under warranty by the owner of the
new radio sending it for repair since the owner has to pay shipping costs both ways. You can expect this from a company that skimps in a simple part to save 50 cents but charges
us hams $1300 for the radio.

The following items are in " as-found" condition, were part of a radio collection I
purchased this past summer & some earlier purchases.
Radio Craftsmen mono power amp RC2, no cage. Overall condition very good to excellent. Dirty but I don't see any pitting. Missing bottom plate, power cord poor. 6V6 P-
P outputs, works well. $120.00. To see a picture of this item goto
http://members.aol.com/vintel/4354.jpg

Heathkit AA191 w/metal case. 3W mono integrated amp. Overall appearance good. Not
tested. Missing 1 foot. $25.00. item 4521

Heathkit A7 (70?) mono integrated amp, no cage. Grey hammertone panited chs. Overall
appearance very good. 12V6 P-P outputs, loud hum only. $35.00. item 4522.

Heathkit UA2 mono power amp, no cage. Overall condition very good to excellent. Gold
painted chs, EL84 P-P outputs. Works well. $45.00. item4523

Merrell MA12 mono integrated amp, no cage. Brown painted chs, overall appearance very
good except a little rust on transformer. 6V6 P-P outputs. Not tested. $25.00
item 4524

Bogen DB114 mono integ amp. no case. Overall appearance is very good. 6V6 P-P outputs. Not tested. $25.00 item 4353

Bell 2256 integrated mono amp, w/metal case. Overall appearance is very good. Not
tested. $20.00 *Matching tuner below* item 4202

Bell 2255 mono tuner AM/FM/FM-AFC. Overall appaerance very good, gold painted case
& face. Not tested. $20.00. *Matching amp above* item 4201

Sherwood S1000 stereo integrated amp w/ case. Overall appearance very good. Brief test
found it dead. $50.00 item 3882.

Knight KA55 stereo integ amp w/brown metal case. Overall appearance very good to
excellent, fornt panel markings excellent. Not tested, missing 1 6973 & 2 other tubes.
$55.00. item 3884

All prices are + S&H from Baltimore, Md. Will consider reasonable offers after this
posting is up for 48 hrs. International shipping available. Contact
vintel@aol.com to order.

Also
10 ea 1X2C & 10 ea 3A3(3A3B, 3A3/3AW3, 3A3C). NIB TUBES. Price $1.50 ea +
shipping from Baltimore, Md.
20 Electrolytic capacators, paper cover, under chassis mount w/ mounting strap, multi-
section, 150V. The type that was used in a lot of "All American 5" radios. All
are unused.
General Inst, Aerovox, Planet, etc. 80 & 50 mfd, 50 & 30, 40, 20 & 20.
$17.00 + $4.00 shipping in contenintal US.

2439. Anyone have schematic of MFJ432 voice keyer?

Newsgroup: rec.radio.amateur.equipment

Agreed. As I understand, these batteries, given regular use of the
radio, should last in excess of 30 years. Of course, putting it on the
shelf and never using it will shorten the life. That's probably what's
going on in most of these battery failures. - Bob

: Paul London ki4xz@peganet.com

Each level does NOT have a LOW and a HIGH setting!

HIGH=5.0 watts
L3=2.8 watts
L2=1.0 watts
L1=0.1 watts

the above are aproximate, and assume a 9.6 or higher dc supply:the 6 volt
NiCad or AA pack will yield lower numbers.

If you are on one of the low power levels(L1, L2, or L3), and you switch
to High, then you are on high.

2457. IC-706MKII Regulator Problem?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-08 00:00:00 UTC
From: kk4bh@aol.com
Message-ID: <19971108135401.IAA23039@ladder01.news.aol.com>
Source record: 162472

I just now started reading postings of reported regulator failures on the ICom IC-706MKII. Seeing I just ordered one several days ago, does this mean I have a "time bomb" comming? What exactly is happening? Anybody out there experiencing this problem. If so, how are you correcting it?

Any comments appreciated.

Ken

I'm sorry the correct outputs must be:
HI (VHF/UHF) 2.5/2.0
L3 2.5/2.0 watts

Wilco de Bree schreef:

Unless you are talking about loss. (That is not actual degrading - it is loss).

about .6-2 DB loss. (Depending on what you are using)

But there should be no degrading, due to sharing the antenna (The loss would be the same even if you ran 2 antennas through the cans) I said SHOULD. Most people are satisfied with 2 DB of desense, but not me.

Seems that the problem was 1989 to 1992 AM/FM/Cassette.
No fix offered to my knowledge, might check with dealers if you have
the extended warranties.

BTW: The problems may exist in other years on other frequencies and
not necessarily only caused by the radio. There are now LOTS of
electronics in the vehicles and some of the problems may not be
related to RADIATED. Some problems may exist as susceptibility to
TRANSMISSONS from HAM radios. (True of all manufacturers.!!!!)

IE. some things are known: not all things are public.

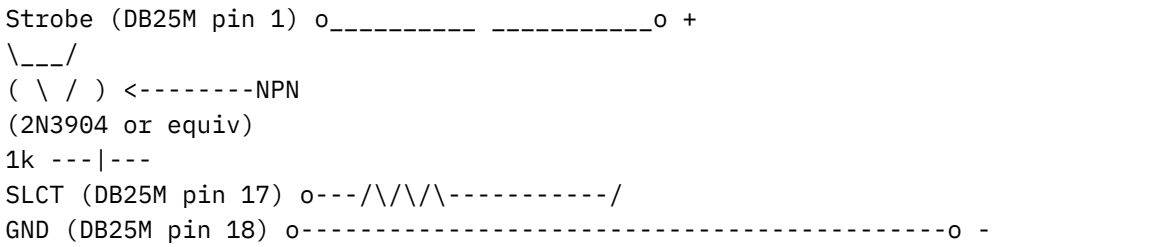
Hello,
I run DXBASE 4.5 and CT K1EA in the manual it has a section that allows you to make
a CW Keying Circuit.



Well, I made this and it used to work on my TS450S but seems not to work on my TS850

Anyone, have another way of making a cable to allow myself to send CW from the keyboard?

2469. Re: IC-706MKII Regulator Problem?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-08 00:00:00 UTC
From: sam <sammy89@hotmail.com>
Message-ID: <34649EEF.2E76BA33@hotmail.com>
Source record: 162484

YES! I know three guys personally who have a 30 day old IC-706 MK II whos 5 Volt regulator failed. I have a source in ICOM CORP.(I will not name she/he), that said they went to a cheaper 5 volt regulator to save 50 cents per unit. This new regulator is much smaller that the older 5 volt regulator and may also not have been attached to the main body heat sink as well also. The problem is that the regulator fails and the rig dies.
BTW, the old IC-706 MK I and early production IC-706 MK II have the larger type regulator so they won't fail. This problem is on the new radios sold in the last 2-3 months.
I son't have serial #s but I suspect the ones on the Dealer shelves haven't been modified.
I will wait 5 months till the old stock is sold off.
Sammy

>presume the HI power output is the same on every level.

There are only 4 power levels in total. The keypad allows you to switch between HI and *one* of the lower power levels. Using the knob, you can access all 4 levels. L1 is always about 100 mW, L2 is always about 1 W, and L3 is always about 2.5 W with any battery pack.

With the 6 V battery packs, "HI" is about the same as L3 - you don't get any more power. At 9.6 V, HI is about 5 W. With a 7.2 V pack, I'd expect to see about 3 W out - more than a 6 V pack, but less than a 9.6 V.

2483. Re: IC-706 MKII Problem with Voltage Regulator Overheating

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-08 00:00:00 UTC
From: ve7vdx@dowco.com
Message-ID: <ve7vdx-0811971528250001@cqt-pm2-061.dowco.com>
Source record: 162498

I had an ICOM tech explain it to me.

The doublesided pc board has a thin layer of bakelite over it underneath
the regulator chip. Continuous heating and cooling can cause the bakelite
to crack and expose the circuit traceing to arcing from one of the pins of
the chip. So as you can see its not the chip itself but an engineering
problem with the pc board. They should have heat sinked the v/reg if it
generates so much heat though.

The fix is one of two things:

1) Raise the chip and install a more hearty space/insulator underneath
the chip
or
2) Cut the pc board trace and install a jumper around the problem area.

I do not know what the symptoms are other than a dead short in the voltage
regulator which I would assume would make it go poof and cause a total
loss of power in the radio.

I am very close to an ICOM repair facility here in the Vancouver area and
the tech said he would make the mod fix for me so I am going to go ahead
and buy the rig.

hope this helps,
Scott

RG-6 style cables are excellent, with low loss, especially the quad shield variety. Make sure you get really good connectors and rubber boots for out door use.

One caution. Since the RG-6 cables are not intended for transmitter use, you will probably be able to find out how much power they can handle. You should have no problems with a 100 watt transmitter as long as your SWR is not too high (3 to 1 or better).

2486. Icom 736 Squelch Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-08 00:00:00 UTC
From: alcom5@i-2000.com
Message-ID: <879049103.30480@dejanews.com>
Source record: 162501

I recently purchased an Icom 736 Hf + 6 meter radio. I notice that when I am in the FM 6 meter mode with the squelch set to full I hear what sounds like static bursts that I would expect to hear when in the AM mode. These bursts sound like light switches being turned on and off or the gas stove electronic ignition pulsing... however, like I said, I am in FM mode and the radio does not unsquelch at all while this is occurring.

The unit does have excellent receiver sensitivity... is this a common problem with all Icom 736's? Or was I sold a lemon...

thanks for any help,
Chris
alcom5@i-2000.com

The following rigs are for sale to make room for a new one:

Yaesu FT-690RII 6 meter SSB/CW/FM multimode 50-54 MHz
2 years new

Condition very good used very little and works like new. Includes:
FL-6020 10 watt PA
MMB-31 mobile bracket (never used)
FBA-8 battery pack with good nicads
NC-26B battery charger
MH-15C8 scanning DTMF mic
CSC-19 carry case and strap
YHA-6 telescoping whip
With original packing materials and manual all in EC.

$475

Yaesu FT-290RII 2 meter SSB/CW/FM multimode
140-150 MHz (MARS A2 5/10/20 KHz)

1.5 years New
Condition excellent, used very little, looks and works like new.
Includes:
FL-2025 25 watt PA
MMB-31 mobile bracket (never used)
FBA-8 battery pack with good nicads
NC-26B battery charger
MH-10E8 scanning mic
MH-15C8 scanning DTMF mic
FTS-7A CTCSS tone encoder-decoder
YHA-14A Helical whip
With original packing materials and manual all in EC.

$475

Non smoker and no mods done to these units.

Am looking for ICOM 575H and 275H in good to excellent cond.

2495. TS440S AT adjustment

From: "Matthew W. Steger" <n3ntj@erie.net>
Message-ID: <346530A9.1FF07797@erie.net>
Source record: 162510

Hello..

Does anyone know how to adjust the stopping point for the Auto Tuner on the TS440s??
I know there is an adjustment somewhere inside that you can tell the tuner to stop when it gets to a 1.2:1 SWR versus, say, a 1.5:1 SWR or 2:1 whatever.
I haven't been able to find anything about it in the Service Manual either. Any ideas??

Thx and 73 de N3NTJ

You don't *have* to assume that. John did cross-post his question to
a CB group and gave no call sign. Maybe that's a bit of a tip.

Date: 1997-11-09 00:00:00 UTC
From: Phillip Nichols <brasheth@gatecom.com>
Message-ID: <3126866859.brasheth@news.gatecom.com>
Source record: 162275

You will notice that one of the contacts
is missing on the AA pack. It is the charging
contact. The AA pack can not be charged so it
is safe. I have taken plastic pieces trimmed
to fit the slot with double sided tape.. I
did this to my 9.6V batteries so the can be used
in the car lighter socket during any charge state
without overcharging. I left the 6v batteries
alone so they can be charged in the car if need be.

The center contact on the back of the battery is
the one to cover up. Not the ones on the bottom.

2506. Inteference from PC Monitor

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-09 00:00:00 UTC
From: martyt@pobox.com
Message-ID: <3465c7a9.39490178@nntp.a001.sprintmail.com>
Source record: 162276

I have my HF station on the same desk as my PC and notice that I hear little "birdies" every so often while tuning the HF rig. They go away when I turn the monitor off.

Seems to be related to the refresh rate of the monitor - if I change to a different resolution, I don't have the problem. But I prefer to use the screen resolution that causes me problems... The monitor is a Gateway 2000 17" SVGA, about a year old.

What can I do, short of relocating the monitor, to eliminate this problem?

Thanks and 73,

-Marty KC0AKA

In article <3464D206.95C46DB4@nbnet.nb.ca>, ve9tv@nbnet.nb.ca says...
>
>Anybody have any comments on this new dual band hand held?. Spec. look
>very good and size is what I want. Thanks 73...Omer
>
>I have a C510 AND a C508. The C510 is of course just a little larger than the C508 but it also has 4 times the output power. The C510 has more features than the C508 which include a Touch Tone pad and more menu items including coded squelch functions.

One thing I have noted though, the C510 doesn't seem to have the image rejection that the C508 does. In certain locations I am picking up out of band signals that are apparently mixing with other signals. This didn't occur with the C508.

Overall though, I am pleased with the performance of the C510. Reports from people I have talked to indicate excellent transmit audio.

Hello John,
I tried to use an MC-85 with an ICOM 751A, and it wasn't worth the effort. I think it is reasonable to assume that the microphone jack pinout for your rig is the same as on the older IC-751A

I made up an adapter cable as follows:

To IC 751A To MC-85
1 1
2 5
5 2
6 8
7 7
all others = N/C

This allowed PTT and Lock to work, but Frequency up and down will not function.

Source record: 162290
Body handling: HTML body converted to readable text

Excellent performer. The filters which use hi-speed DSP have
shape factors approaching unity - - when you tune the receiver the signals
pop in and pop out with adjacent channel QRM at a minimum.

Message-ID: <3466A86F.199A@sj.bigger.net>
Source record: 162291

I have a Autek MK-1 Keyer... I also have a parts layout and a schematic, neither of which seem to match the MK-1 that I have.. I think this is an early version of the MK-1 and the schematic is version B. Does anyone have a parts layout and/or schematic for the early version of the Autek MK-1 keyer?

Thanks for any help..

2524. SGC Autotuners in dipole configuration

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-09 00:00:00 UTC
From: Don Gray <lbol@julian.uwo.ca>
Message-ID: <01bced61$95889c60$0100a8c0@don>
Source record: 162294

Thanks for reading this.

Looking at the literature regarding the SGC-231 (http://www.sgcworld.com/smartuneri.gif) I notice that they can be used in a dipole centerfed and dipole feedline configuration. I can't understand how this is accomplished since the output of the tuner is meant to be connected to a random length of wire (i.e. from an insulated single terminal on the tuner). Does anyone know what SGC means by dipole configuration ? Do they propose that a feedline be connected between the output for the random wire and ground then connected to the feedpoint of a dipole ? What impeadance and type (balanced / unbalanced) of feedline is used ?

Thanks for any responses.

If you use the FT-50 in the car a lot, you might also want to try using it with the alkaline battery case instead of one of the NiCd packs. You can leave the battery case empty, since the cigarette lighter adapter provides all the current needed for full-power transmit. The radio is *much* lighter with an empty alkaline case on the back.

Or you can put 4 batteries in the case, and have a backup battery pack for emergencies. If you use lithium AAs, they don't add much weight and their shelf life is very long (10 years). Lithiums also work well below freezing, a useful attribute for an emergency pack. Alkalines are much cheaper but heavier. But even 4 alkalines are considerably lighter than the NiCd packs.

You can try those Rad Shak filters that clamp over the lines. Had luck with them on some monitors. Relocation seems to work, I just relocated mine today abt 12" further away from the rig es most of them disappeared. Keep all your excess lengths of wiring coiled up as much as possible. Also try to isolate the rigs wiring from the computers wire as much as you can.

What I think he really meant so say was "�ę□L��!��□��ę�m", because you simply cannot perform that kind of function without the appropriate modification, otherwise the FXO will shatter along the pipestem, making the radio totally implausible.

A easy way to use any impedance coax with 50 ohm transmitters and antennas
is to cut the transmission line to be an electrical (or multiple) half
wave-length. This is easly found by l=(468/f)*VF where f= freq in Mhz,
VF=velocity factor of the coax and l= the lenght of a electrical wavelength.
I use Belden 9213 (75ohm .3db loss at 30mhz per 100') during my portable
contests efforts using this trick. Many hams use CATV 1/2 & 3/4" hardline
for long (>500') using this same method!

Hi k4adl
I think you read the message too fast. What the guy really means is that
his G5RV can't tune at all on 2 meters. Lucky guy, mine won't even tune on
75 meters.

Buy the IC 756. You'll be delighted with the LCD and will not do without
a visual readout once you've been spoiled by this one. I've had the 756
for 9 mos and it sits beside a 751. The latter is a great transceiver
but doesn't compare with the new 756. I compared the 775 before
settling on the unit with the LCD.

Regards,

Bill-W5YJB

Gentlemen,

Sorry that I didn't see the original post and can only respond to the response.

Use of 75 ohm cable with 50 ohm equipment is not as strange as it may seem.

The impedance seen by your transmitter (or tuner, if you are using a tuner) is not the impedance of the cable - it's the impedance of the load at the far end of the cable, transformed. The transformation is a function of the frequency, characteristic impedance of the line, and the length of the line.

For example, assume that the antenna presents a complex impedance of 75+j60 (109 ohms magnitude). Further, assume a 75 ohm cable and a

length of cable of 0.15 wavelength. For example, at a frequency of 3.8 MHz the cable would be physically 29.13 ft. This is from the equation relating the number of wavelengths (N), length (L), velociy factor(VF) and frequency(f). (I used VF=.75 for RG-6)

N = L * f / (984 * VF). (VF=.75)

If you now go to the Smith Chart with these values (0.15 wavelength, 75 ohm line, and the antenna impedance above, you will see that at the transmitter the impedance will be seen as 50 ohms. (50 + j0). So, there's an example of how the 75 ohm line can be used effectively.

My general advice is to become familiar with transmission line theory and the Smith Chart. You then have to put connectors on various lengths of cable and be prepared to use them where needed. It often turns out that a specific length of some strange characteristic impedance is just what you need in a given situation.

Good Luck,
Bob

I have two of RS things - paid $25 each for them - very pleased for
the money. I use them outboard older Drake tube gear and they've done
a good job. OTOH I bought a JPS NIR-12 at Dayton and sold ir shortly
thereafter (most of the filtering modes were unusable).

>
>Ron

I got this off this newsgroup awhile after the radio was introduced.
It worked for me.
All caveats apply!

Remove both top and bottom covers.
Unplug the speaker and set the covers aside.
Lift up on the 6 tabs on the top and bottom of the front of the radio
and remove it.
We should now be looking at the back of the faceplate receptical.
Position it so that the voice modual is at the top while looking down
on it.
Below and to the left of the modual is a V shaped copper spring.
The resistor we want to remove is in the 0 (zero) position
Remove nothing else.
Do a full reset per the instruction manual
You should now have 300 to 470mhz receive on UHF
410 to 470 mhz transmit.
118 to 174 mhz receive
and 136 to 174 mhz transmit.

I have heard that 800 mhz reception is possible, but I haven't been
able to find much on it except a posting on packet from a guy in
Belgium. His description of the mod sounded cryptic at best so I left
it alone.

FS: Two voice cipher units, made by Siemens, type MSC2001A, date code 1987

The units are brand-new in box. I opened one box to check out the unit, the other unit is still in its original blister plastic inside the box

The units are the size of a small cigar box, army-green of course

Complete documentation (functional description and schematics) is included

$190+shipping for both. Prefer not to sell separately. Can not sell outside US for export restriction reasons.

>K0MB

Good answer.

Why can't people be more explicit?

To all users of the NewsGroup :

If you ask a question like this, you invite answers "in kind" - which does nothing for you or the other readers.

If I may make a suggestion of some Do's and Don't's to those who originate queries:

a) Explain why you are asking. This usually give some clue about your circumstances or situation. Are you a ham, an SWL, or a chicken-bander? Do you intend to run 1500 watts or will barefoot equipment suffice?
b) Provide the constraints - it's a waste of time to explain to someone how to build a 160M end fed Zepp, if he only has a 50' by 75' city lot.
c) Don't provide the answer - it only closes off the better options that you might hear about. If you specify objectives and functional needs in stead of jumping to the answer, you will get better responses.

Here's an example of how that query MIGHT have been written:

I have a 80 meter dipole at 45' and an R-7 vertical, and I want to put up horizontal antenna for 40 M in order to see how it compares with the R-7. I have read about the "coaxial" dipoles and the G5RV and I have information on the 40 Meter Center Fed Zepp from the recent QST article by N4CP. Can anyone suggest some trade offs or other altenatives?

That doesn't meet all of my Do's and Don't's, but you could at least try those as hints for getting better answers.

Wait for rhe ICOM IC-746 Due out in February. It is on the HRO Contestor page,
or Texas Towers page under "SPY PHOTOS". It will be like the IC-756 but will have
a faster Scope and 50 watts on 2 meters all mode. It will cost $1600 or less at the Ham
Store. I got this info from Icom USA and several Ham Dealer Salesman. Wait and you will be much happier.

I have a Autek MK-1 Keyer... I also have a parts layout and a schematic, neither of which seem to match the MK-1 that I have.. I think this is an early version of the MK-1 and the schematic is version B. Does anyone have a parts layout and/or schematic for the early version of the Autek MK-1 keyer?

Thanks for any help..

There is an adjustment that can be made to the squelch system. I have
seen several go this way. Not a serious problem, rather a small
nuisance. Should only take the tech about 10 minutes to fix this.

Hello John,
I am not familiar with a 2830, so I have to assume that it's just
another all-mode, all band transceiver. And I will assume that it is
tube - not solid state - not that it will matter from my perspective.

Sorry that you are already in receipt of such a negative response from
Phil.

In my opinion the G5RV is a good antenna, even though it can be
difficult to match on 40 and 80 and downright recalcitrant on 30M.
However, I have always managed to tune one to a perfect match with a
roller inductor tuner. If you buy a tapped inductor tuner, I think
you're throwing your money away.

I've tried all kinds of verticals and there isn't but one that can
come close to a dipole or any other reasonable length wire antenna,
and that's my 80M vertical with 8 tuned counterpoise wires and top hat
loading with loading coil.

HOME AUDIO AMP (Needs repair) $65 or best offer

TOP LINE SANSUI G-5000 AM-FM HOME AUDIO AMP.

Was very expensive transistorized amp at one time.

METERS: Signal Meter & Tuning Meter

BUTTONS: Speakers A/B; Tone; Sub-sonic Filter; Audio Muting;
Loudness; FM Muting; Mode; Tape Monitor; 4 Channel
Line Adaptor, Source Tape.

KNOBS: Bass; Treble; Volume; Balance; Tuning; Selector of
Modes

MICROPHONE: Mic. Mixing Level Input; Input Phones/Mic.

This unit needs repair and is sold as is.

$65 or any reasonable cash offers considered.

Would consider a tube tester (Military or Civilian) in trade,
perhaps needing repair too.

Thanks.

2578. 2M repeater problems

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-09 00:00:00 UTC
From: dan@scdh-138.umd.edu
Message-ID: <643781$68s@dailyplanet.wam.umd.edu>
Source record: 162386

I am running a 2M repeater and am having some serious problems with its performance. The repeater has never worked very well and we have ended up replacing essentially everything but the feedline and the antenna. The current set up of the repeater is as follows:

CAT-1000 controller, Kendecom Mk4 RX/TX pair, 5 cavity Wacom BpBr duplexer with an additional Bp cavity on both the RX and TX side. There is also a Telewave isolator (circulator+35W dummy load) between the TX Bp cavity and the transmitter. All cavities are 8" round, isolation is probably in the neighborhood of 115dB between RX and TX, with about 40dB rejection to pagers on both RX & TX.

Power comes from an Astron rack mount supply and a dedicated 24V supply for the final output transistor in the transmitter.

The noise is only present when the transmitter is on (ie, there is no noise that is randomly keying the repeater, and when the repeater is unsquelched, and the transmitter is turned off, the received signal is fine). The noise problem depends on output power. The Mk4 is capable of putting out about 33 watts, and when transmitting it horribly deafens the receiver. We installed the RX Bp cavity inline with the TX change causing a 90% power reflection into the isolator and only about 2W out to the antenna. The noise virtually disappeared.

It's also interesting to note that it is unlikely the problem is in the transmitter. For a while we had replaced the Mk4 TXer with a Motorola Syntor, I found that the repeater was virtually unusable unless TX power was below 10W.

The noise goes away when the transmitter is connected to a dummy-load and decreases when hooked to a weaker antenna. There is a very strong pager presence at 152MHz, which is why we got the Bp cavity on the transmitter side, although that doesn't seem to be helping.

The antenna itself (as well as the feedline, cavities, isolators, and radios) appear to be in very good condition mechanically, SWR is virtually nill, and impedance is correct. As far as I can tell all the cavities are properly tuned (they were tuned by Wacom).

I'm really at my wits end. I'm virtually positive the problem is that the transmitter signal is mixing with some other signal and causing interference on our receiver frequency. However, I don't believe the problem is in the antenna or feedline since the problem is present on multiple antennas. It also doesn't seem to be present on the transmitter, since the Bp cavity (and isolator) should prevent strong signals from entering the transmitter (furthermore since the Syntor did the same thing, it doesn't seem likely its

the transmitter).

The only thing that I can think of is that the power supplies do not have proper earth ground (and the antenna isn't grounded either). I know that our 120V power is pretty dirty, but the 12/24V supplies seem fairly clean from looking at a scope.

If anyone has any suggestions I'd love to hear them. If anyone is in the College Park, MD area (Metropolitan Maryland) and would like to come over and take a look, I'd be very appreciative.

Dan Meyer, N3UBM

WOLLENSACK STEREOPHONIC COMPACT REEL TO REEL TAPE RECORDER

It's the stereo version of the monophonic model 15-70 portable model.

Nice sounding and running unit for it's age.

Mostly chrome or stainless steel case. Metal speaker grill has some light rust in parts that can be easily taken care of to make it perfect.

Dual 3 3/4 & 7 1/2 IPS tape playing speeds.

ILLUMINATED COMBINATION KNOBS:

- Volume/Auto. Record Level

- Tone/Treble/Bass/Off

- Record Level Meter

INPUT JACKS

- Radio/Phono

- Microphone

OUTPUT JACKS

- Speaker Switch/Record Only

- Accessory Amp

- Earphone/Speakers

TRACK SELECTOR CHART IN UNIT'S COVER

- 2T monaural or stereo
- 4T stereo
- 4 monaural tracks

Has standard record, play, rewind & forward controls

Cannot get the digital tape counter to work is the unit's only short coming. I would guess that's an adjustment and I'll leave that to the buyer.

$75 or best offer, plus shipping and handling which won't be much, because I'll pack it free.

75 Ohm cable is pretty much okay at HF, although the impedence mismatch may
make your transmitter back down on power. All you need to do is put in a
tuner and tune out the mismatch and you should be all set.
There may be antenna considerations as far as baluns go but I'm not too
sure about them so I'm not going to tread there. Look in the antenna
handbook or the Amateur Radio handbook and they'll tell you what you need
to know.

You didn't do the math, did you? There are quite a few appliances in a house that draw about 10 KW. At 220 volts, it is less than 50 amps.

If you can find an RS-232 Level converter, you can use the 232 with your comodor.
You must have this device. There use to be diagrams floating around to build one, but I havn't seen one in a long time. ONce you get this, you can use any terminal software to control the PK-232.
AEA use to sell a package with software and a converter together. Software was on rom. It all just plugged in and worked...
The only drawback to using the C-64 was the 40 column screen.....
otherwise, It was great....

I saw a post by a guy in Vancouver who said the It isn't the regulator but the bakelite crumbling from the constant heating
and cooling of the regulator chip. I don't entirely agree. I personally know several guys who just bought their IC-706 mK II
less than 40 days ago and two of them only used it to recieve since they didn't have a suitable transmit antenna. It has to be somthing New that Icom is doing for these usnits to fail. I would believe the constant "hot/cold" story if the radios were 1 year
old etc. But radios that are 1 month old going dead due to a regular overheating? HMMM
If you do a search of this post you will see guys from all over the worl having the same exact problem. I suggest Icom does
a total recall on all Ic-706 Mk II at the Dealers or ones that are recently sold (serial # to match new regulator chip).
It appears that that Icom has a policy of just "covering their eyes" to this problem and will just repair the units as they die!
Yes Icom USA will pay return shipping but not the shipping to them.

>and therefore results in a different low power output for each level. I
>presume the HI power output is the same on every level. Any help will be
>appreciated. 73

There is no LOW and HI setting for each level! According to the manual
there are 4 levels you can select: HI, L3, L2, L1

HI 5 Watts FNB41/42 2,5/2 Watts FNB40/49 2/1.5
Watts FBA15
L3 2.8 " "
"
L2 1 " "
"
L1 0.1 with all battery packs

In the menu TXPO 02 you can set the power level of the LOW position.

>Thanks in advance.

>John, N4WFK

I can't speak about these models, but I have restored R71A receiver's
that lost their PBT controls. Your mod may or may not be similar in
nature:

1. In the IC-R71A, the dual PBT/Notch control is replaced with a
single (for Notch only). The PC board is the same inside, so you have
to replace the control (potentiomenter) ($15) and both external knobs
($4) to restore this part. The second (rear PBT) element is jumpered
to bypass these connections.

2. If you want the front panel nomenclature to show PBT for this new
control, you will have to order the appropriate front panel casting
(about $45).

3. You need to put the PBT IF filter back in. The factory stock
unit is about $55, the better FL-44A is over $200 new now (whew).
There is a spot on the PC board for it... it simply was replaced with
a coupling resistor to bypass this part of the layout.

So, simply removing this resistor, adding the filter back in and
restoring the control is all that is electrically required. The front
panel is optional. If you do the front panel, make sure you get the
logo plate and new window to go with it.

GET THE SERVICE MANUALS!

I found all all I needed to know about these changes from the Icom
factory Service Manuals, including part numbers. It also helped me to
compare the schematics for both old and new R71A to the even older R70
(which is almost identical RF-wise).

I hope this might help you in your investigation for the 761/765!

I have forsale a Kenwood TS-520SE transceiver 160m- 10m. It is in excellent condition, almost like new condition and works great. I would not part with it except that I am buying a house and this is a back up rig.

Please send an e-mail if you have an questions about it. If you are a new ham and want a very nice hf station without investing a lot of money this is the radio for you. Work SSB or CW with over 100 Watts output from the pair of 6146 finals. It has only 3 tubes in the transmitter section and is all solid state in the receiver section. I have the optional 500 HZ cw filter installed but will charge extra for that if you want it left in.

Selling price for the TS-520SE, including manual is $275.

500 HZ CW filter is $45.00 extra but worth it if you like CW.

You must pay the shipping cost.

e-mail: ad4mz@hotmail.com or call 704 286-0194.

This was covered in a Technical Correspondence article in QST between
5 and 10 years ago. I used to have the article, but recently cleaned
it out of my binder along with other articles I didn't think I'd ever
have to refer to. It describes exactly what you want to do, and it
involves rewiring the control and a few other minor changes. It
apparently makes a real difference in the rig's performance.

Sorry I can't come up with the issue, but I think it's worth your
pursuing. Hopefully this post will trigger someone else's memory
and/or they still have all their QSTs from that time frame.

> Yaesu Japan will announce shortly the NEW FT-846 HF/6 meter radio!!

And 2 meters and 440. I was asking about this the other day. The
only info I have is that which comes from Page 30 of the HRO Fall/Winter
97 catalog. Price is TBA. As of the catalog printing it had not been
FCC aproved.

> BTW you can get a great Deal on the FT-900CAT Now. Most hams stores have
> reduced the price to $1200 and include the 500 HZ CW filter that normally
> goes for $170 !! You also get the built in Collins SSB filter plus the
> free separation kit ($50).

That same catalog lists the 900CAT at $1319.95.

I am glad that I can provide a little bit Chinese to English
translation for you so you'll know what this xyz guy is talking about.

Regazrding to the topic, he's saying that the so-called HAM's in Hong Kong
are boring and mentally retarded.

Not to anyone's suprise, this guy uses the "harts.org" suffix. It is the
acronym for "Hong Kong Amateur Radio Transmitting Society".=20

We had the opposite problem during Field Day this past summer (the big gun HF club member brought a generator and a linear amp to our Field Day site, and it swamped the PC we were trying to use for packet). What we did was wrap the monitor case and all the cables with aluminum foil, so there was no exposed plastic case or unshielded wiring outside the metal computer system unit box. We also had to wrap the keyboard with foil (it had far more problems than the monitor did). Thankfully we didn't have to cover the ventilation slots on the monitor; if you have to do that, I would suggest metal window screening (like you would find in a screen window of a porch door) as the wrapping; the holes should be small enough to block any frequency the monitor would emit without blocking airflow. Stitch the screening together with wire, of course (a custom-tailored jacket for your monitor :-).

Make sure all the shielding is connected to ground, of course.

You could also try filtering the power cords (especially if the monitor and your radio are on the same circuit breaker run). Typically, get a large ferrite core, and wrap the power cord through it as many times as the plug will fit through the center hole of the toroid. You could probably stop the aluminum foil wrapping of the cord at the choke coil you would have created this way, i.e. foil-wrap the cord from the monitor's shielding wrap to the choke, including wrapping the choke, too.

: Well Bill,
: That calculation may may be close for your electric range, but I have
: yet to see an amplifier that is 100% efficient.

Yeah, but... In neighborhoods where houses were built with electric heat,
and gas came through later, like mine, many houses have excess electric service
capacity. Mine has a 400 amp service, and no longer uses the 2*60A @ 240V
that fed the 20kW electric furnace; nor does it use the power that fed the
electric hot water heater. But...I'll bet most 10kW output amplifiers have
3-phase power input, and that would be a serious problem in residential
areas.

(Me?? I'd much rather use simple, low power equipment and get
satisfaction from operating skill and effective but simple antennas.)

Kenwood TS440SAT with CW/SSB filters, freq display/transmit mods. Works fantastic, looks great. Used mainly for 40m DXing. $700+shipping

Drake project: TR4, MS4, AC3 (all in good condx), TR3 (fair condx, not working). No time to play with these and they're taking up space. Also Astatic base mike. $225+shipping (firm)

Tempo 130A10 2m amplifier (made by Henry). 5-20w in, 130 out. 12VDC. Mounted on plywood base (from using in trunk). Make offer ($ or trade).

Toshiba 286 laptop and case. Works well with DOS packet, RTTY, and logging programs. Make offer ($ or trade).

Looking for Kenwood accessories (SP-930, MC-80/85, filters, etc.) and multi-band antennas (tribanders and verticals)...

David, NA2AA

What I really like is that the unit has a booster that turns
it into a 50 Watt mobil. Tech America has both for $599.00,
call 800877-0072 or < http://www.techam.com >. The booster
plugs right into the bottom of the handheld. Looks a lot like
the old Standard mobil that had all the controls in the mike.

2631. Icom 706 vs. Icom 706 Mark II

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-10 00:00:00 UTC
From: nitz@selectsa.com
Message-ID: <647tv9$an8@clarknet.clark.net>
Source record: 162232

To all Icom fans who have owned/operated both radios:

I want to know if purchasing the Icom 706 Mark II is worth the extra money.

I am planning on purchasing either a used 706 (probably in the $800 - $900 range) or a new 706 Mark II for $1300.

I am planning to use the radio for HF mobile operation, HF portable operation and VHF base/mobile operation. Most of the time will probably be spent on the HF bands.

I've read about the enhancements and wonder if you've noticed that the receive/transmit audio is measurably improved, etc.

Thank you in advance for your experience and comments.

73,

Jim Nitzberg WX3B

>with.

I recommend that you mail your list to Deane:

Deane Kidd
27270 S. W. Ladd Hill Rd.
Sherwood, OR 97140
503-625-7363

Deane is a great old guy who worked for Tek for more than 40 years.
He has almost any Tek part or manual that you might ever need and is
happy to take your call as long as you're paying for it. Give him
your serial number and he will make sure that the manual you get
covers your instrument properly.

He has an incredible array of Tek parts and may be able to find many
of the things you need. You just need to give him time to find them.

A phone call will be entertaining, but for a list this long you need
to send him a hard copy and give him time to think about it.

I have forsale a Kenwood TS-520SE transceiver 160m- 10m. It is in excellent condition, almost like new condition and works great. I would not part with it except that I am buying a house and this is a back up rig.

Please send an e-mail if you have an questions about it. If you are a new ham and want a very nice hf station without investing a lot of money this is the radio for you. Work SSB or CW with over 100 Watts output from the pair of 6146 finals. It has only 3 tubes in the transmitter section and is all solid state in the receiver section. I have the optional 500 HZ cw filter installed but will charge extra for that if you want it left in.

Selling price for the TS-520SE, including manual is $275.

500 HZ CW filter is $45.00 extra but worth it if you like CW.

You must pay the shipping cost.

e-mail: ad4mz@hotmail.com or call 704 286-0194.

I don't have any concrete info at the moment but I heard it will replace
the FT-900CAT.
BTW you can get a great Deal on the FT-900CAT Now. Most hams stores have
reduced the price to $1200 and include the 500 HZ CW filter that normally
goes for $170 !! You also get the built in Collins SSB filter plus the
free separation kit ($50).
Not bad. I paid $1300 for my stripped FT-900at and paid another $50 for
separation kit
plus $340 for the Crystal SSB and CW filters for a total of $1700 !! Now
you save
$500. Not to bad. I still would be interested in this NEW RADIO!! FT-846
!!!!!

Have an excellent shape *ICOM IC-R7000* Professional grade Monitoring Reciever.
Includes Original Matching External SP3 Speaker.
Speech Synthesizer Option Built in.
Has Scan Speed Increase Mod, Extra 100 Channels Mod, Discriminator Tap & SCA Audio Mod.
Everything functions Perfectly, all knobs, buttons, display, audio, etc... is/are in perfect working order, no faded markings, letters, numbers - low mileage - never used outdoors.

Includes AC Power Cord, Phono-1/8" Cable, Manual, Original Boxes & Packaging.
Makes a super Software controlled reciever system for Monitoring/Logging/Surveillance/SETI use...

** SELL FOR $999.00 + $50.00 Shipping **

EMAIL; jg@izap.com if interested.

IC-R7000 SPECIFICATIONS
GENERAL

Frequency Coverage (U.S.A., Europe, Australia): 25.0000 MHz to 999.9999 MHz, 1025.0000~ 1999.9999 MHz Mode:
SSB (A3J) AM (A3), WFM, FM (F3) Tuning Step Increment: - 0.1, 1, 5, 10, 12.5, or 25 kHz.
Power Supply Requirement (U.S.A): 117 V AC +/-10%
Usable Temperature Range: -10C ~ +60C; +14F ~ +140F
Dimensions: 286(W) x 110(H) x 276(D) mm, 11.3(W) x 4.3(H) x 10.9(D) in
Weight: 8.0 kg; 17.6 lb.
Sensitivity: 25.0000 MHz~999.9999 MHz SSB - Less than 0.3 V for 10 dB S/N AM - Less than 1.0 V for 10 dB
S/N FM - 0.5 V for 12 dB S/N FM(Wide) - Less than 1.0 V for 12 dB S/N 1240.0000 MHz~1300.0000 MHz B -
Less than 0.3 V for 10 dB S/N AM - Less than 2.0 V for 10 dB S/N FM - 0.5 V for 12 dB S/N FM(Wide) -Less
than 2.0 V for 12 dB S/N
Selectivity: SSB - More than 2.8 kHz/-6 dB, Less than 11 kHz /-40 dB AM, FM - More than 15 kHz/-6 dB, Less than
40 kHz /-40 dB AM, FM(narrow) - More than 6 kHz/-6 dB, Less than 18 kHz /-50 dB FM(Wide): More than
150kHz/-6 dB, Less than 380 kHz /-20 dB
Audio Output Power: More than 2.5 W at 10% distortion with an 8 ohms load.
RF Connector: "N" type connector (female).

OPTIONS

EX-310 VOICE SYNTHESIZER UNIT: Provides audible, synthesized readings of frequencies in English. $ 129.00
SP-3 EXTERNAL SPEAKER: External speaker. Matching style and size with IC-R7000. $ 172.00

Product Release

QVR Designs has released a new line of encapsulated HV power resistors
(See enclosed picture 10K/20W/35kV).

The encapsulated package features a non inductive bulk ceramic resistor
having the power and voltage rating as needed fot your requirment. In
addition, provided are mounting isolators having the voltage rating as
needed for the application.

For a free quote send Email, call or fax your required rating to:

Well, I don't think you're going to find anyone that will tell you it's possible. You could do it, theoretically, with some sort of switch, controlled by the computer, that could switch between the two controllers, but your software would have to be written to support that, and I doubt there is anything out there written to do it.

Just in case you're the inventive type, here's how I'd try it:

The serial port has several control lines which are normally not used by things like a packet controller. I would design a switch to toggle between the two devices according to, say, the Ring Indicator (RI) line. When the RI line is high, the switch would connect device_1 to the serial port. When it is low, device_2 would be connected. Then you would have to have software that could toggle that line to switch between the ports at the right time.

2659. Question: Have Hum on 2M

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-10 00:00:00 UTC
From: Clete <Cletus@vabch.com.HAM>
Message-ID: <01bced94$8719f7e0$a09960d1@Cletus>
Source record: 162260

I am getting a hum in my 2M mobile radio (base mounted) signal. Hum occurs across 2M band on High power (25W) and only below about 146.00 on Low power (5W). My power supply is brand new Radio Shack <gulp> 10AMP and SWR is 1.5 or below across the band.

I'm leaning toward the supply (if for no reason other than the brand!!) but would like other ideas.

Thanks in advance.

Source record: 162265

I agree with this assessment. The 756 is the better radio for the money, especially the receiver. I had the chance to visit the Icom factory here in the Seattle area, and listened to both the 756 and the 775 side by side, switching quickly from one to the other in their "dream station". I couldn't believe it at first but the 756 was definately more sensitive in picking out the weak signals. Even the Icom technician who was looking over my shoulder the whole time agreed with me! In addition, Icom had two 775s set up in the station, one of which had a main tuning knob which got stuck and squeeked. I was not impressed. When I returned the second time, over a month later, the same squeeky 775 was still in the shack! Not too good in the quality control and PR dept! Considering the huge difference in price, I'd go with the 756. Granted it doesn't have all the features, but it certainly has the ones you need most of the time. With your savings you could buy a good amp and antenna! Just my opinions, of course....John, K7JY.

"Leaning"? -- we'd all just be "Guessing", too, without more tests. You
did not mention your hi/lo power levels -- but 10 amps may be a bit light.
It may be a 10 amp supply but the regulation and hum will be worse as
you approach the manufacture's 'claimed' specification -- esp. if it's
assembled with lots of little metric screws <g>.

Borrow a friend's p/s (of equal or higher amperage) and do an A/B test.
-and/or-
Pull the battery out of you car and run it on the same feedline/antenna
combination.

Cross-posted to: alt.ham-radio.hf,alt.ham-radio.ssb,alt.ham-radio.vhf-uhf,rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Gary (kc5ldn@--NO-SPAM-sprintmail.com) wrote:
: Please help! I have a large quantity of RG-6 and would like to use it for
: HF. I need to know if it is okay and if there is any considerations since
: it is 75 ohm and most HF and VHF rigs call for 50 ohm. Any suggestions and
: info would be helpful.

(I trimmed the followup-to line to just rec.radio.amateur.antenna...seems like this doesn't need to be in 7 different groups!)

I agree strongly with the response that mentioned that a 75 ohm cable can be used to transform a possible antenna impedance to 50 ohms...and the key is knowing what impedance your antenna is, and using a chart or formulas to find out what impedance your rig, thru the coax, will actually see. But for one very practical use on HF, you can see that 75 ohm line may give results no worse than 50 ohm line: if you feed a dipole that's up high enough to have a nominal 75 ohm resonant feedpoint impedance, then that 75 ohm line will deliver a 75 ohm load to the transmitter, a 1.5:1 SWR. If you used 50 ohm line, your 75 ohm load still yield a 1.5:1 SWR, at least at the load end of the line, and it won't be significantly better at the transmitter if the line is low loss. In either case, to get to 1:1, you need some impedance transformation, like a tuner, and you might just as well use that RG-6, which will have loss nearly as low as RG-8 solid dielectric line. (I'd expect nearly any transmitter with a tuned output stage, like the TS520 series, to handle 75 ohms just fine; and transmitters like the TS440S with the optional built-in autotuner should also be able to handle that 1.5:1 without any trouble.)

There's RG-6/U, and there's RG-6-type (many different varieties!)...the graph I have of safe power handling for RG-6/U shows 1kW at 14MHz and below, falling to about 300 watts at 150MHz and over 175 watts at 450MHz. The graph is based on a maximum ambient temp of 40C, and line in free air, and 1:1 SWR.

Or put an oscilloscope on the power supply output and see if ripple shows up when the transmitter is keyed. Or even a DVM reading millivolts AC should show the presence of ripple on the power.

Hi,

I am trying to recondition some older Tektronix equipment for my personal use. I have made an extensive list of obsolete Tektronix parts that I am looking for. Perhaps, you have some of what I am looking for in your collection? I would like the parts to be in "as new" condition, if possible. I would appreciate it if you would look through the list to see if there is anything that you can help me out with.

1. K213/Model 3 instrument cart with shelf

2. 7A13 DMM plug-in

3. Tektronix blue paint in spray

4. TM-503A mainframe in mint condition w/option 7 if available

5. TR-502 Tracking Generator plug in parts:
a. SMA interconnect cables to spectrum analyzer (012-0649-00)
b. logic interconnect cable to spectrum analyzer (012-0648-00)
c. SMA male to BNC female (015-1018-00)
d. retainer, plug-in (343-0604-00)

Hello everyone,
I have a 350 Hz CW filter for the Yaesu FT-707.
I would like to swap it for a AM 6 Khz filter. If anyone is interrested or
has the AM filter for sale, please e-mail me with a proposal.
Thanks to all.

2673. Help..FT-5200 mod

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-10 00:00:00 UTC
From: Don Vlack <k2dv@frontiernet.net>
Message-ID: <346651EA.7B57@frontiernet.net>
Source record: 162297

Hi all. I tried to modify my FT-5200 for extended rx/tx using the files I found here. I solder jumper pads 1,3 and 6. I hit the approriate buttons when I turned it on, and got the requisite readout. I COULD NOT put in any frequencies! When you power up the radio it shows the freq 000.000 and 300.000. You are then instructed to put in the upper and lower limits. I can't. When I turn the dial, it beeps but the 000.000 remains. Using the button on the mic. results in the same thing. Lots of beeping but no change in the display. I'd really like to have the mod. Any ideas?
Thanks

Won't be able to help on the MFJ-1224 side of it, but I've noted that
people seem to have trouble with the Kenwood accessory plug.

Here's what I use:

[Pin numbers are for the ACC2 on Kenwood TS-450]

Pin 8 GND
Pin 9 PKS [<-- PTT from TNC]
Pin 3 ANO [--> RCV Audio to TNC]
Pin 2 RTK [<-- FSK from TNC]

This wiring allows entire interface between ACC2 and TNC - i.e., no
connections are required into the microphone cable. The rig operates
now in true FSK mode - not AFSK..

My wonderful example:
>For example, assume that the antenna presents a complex impedance of
>75+j60 (109 ohms magnitude).

would have been a lot better if I had said "75-j60" instead of 75+j60.
Then the reader would have been able to follow the path around the
Smith Chart and gotten the correct answer.
Sorry about that.

I have also noticed that the Squelch does not work very well. I have
never used the
ADMS software yet.

My theory is that the squelch does not work well when the battery is a
bit low. The
squelch opens up spuriously and/or chatters a lot when I used the
alkaline battery, also,
further suggesting low battery voltage as a contributing factor. It does
not take much, though.

I also have noticed that the radio has terrible sensitivity outside the
440 mHz band. I was
very sad to see how poorly the unit performs as a wide band reciever.
Even switching antennas
barely helps. The manual clearly shows the specs as very poor as a
reciever, but I was
sad to see just how bad they really were.

2685. Yaesu FT-101 Information Web Page !!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-10 00:00:00 UTC
From: aor@gteais.com
Message-ID: <879169360.6466@dejanews.com>
Source record: 162309
Cross-posted to:
rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.boatanchors,rec.radio.swap,rec.radio.amateur.antenna

I have created a web page dedicated to the FT-101 series radios.
This span covers the original FT-101 in late 1971 thru the FT-101F
in 1979. All of the station accessories are described with
technical data. More info to follow as this page is still
under construction. 11/10/97

http://www.qsl.net/nw2m/ft101.html

I need your help in completing this task. Please check back
with this message for the latest updates and needs.

Needs: (I expect to be finished in Feb/Mar '98)
0. Scanned FT-101 photos/stations! (crop to 600 wide, JPG format)
1. Information and description on the FR101/FL101 twins.
2. Info on the FTDX-560/570 prior to the FT-101
3. Info on the FT-101Z and ZD radios after the FT-101F
4. List of Yaesu repair centers and folks who restore FT-101's
5. Someone with QST from late 1971 thru 1980 who can provide
issue/page numbers with cost information for the FT-101 and
station accessories. The last ad I saw was in 1980 (QST)for
the sole FL-2000 amplifier (as excess inventory).
I would like to know when each of the new series were
introduced and the costs.
6. Replacement and substitution parts. Ie, what is a modern
substitution fot the 3SK39/3SK40/406x7 MOSFET transistor
for replacement. Where can originals or subs be bought?
Where are final tubes found (6JS6C)? Costs, addresses.
7. Someone who can scan and convert larget tune-up diagrams
and cheat sheets into PDF files.
8. Comments and suggestions... (constructive please!) :-)
9. Any other FT-101 history that I am forgetting....

73,

Al, NW2M

I had the same experience just last Friday. I had just drafted the
following to send out on the net. What I am really amazed at is the
inability to clear the problem with a hard reset. I suspect it
has something to do with old version of radio firmware. If you have
had this happen to you please let me know what firmware version you are
using.

BTW I was able to program with ADMS a memory with 2M xmit and
440 rcv, but the radio refuses to xmit from that memory (just
flashes the display when you push the PTT). I was specifically
told by RT Systems that this should work.

BTW the version on my ADMS SW disk is V1097.

Dave - K8RSP

==========

I wonder if others have experienced this
problem. I just got the ADMS 1D software
and tried it on my VX-1R. The SW seems to
work fine but now my radio's squelch no
longer works properly. The regular squelch
remains open on the NFM Rx mode no matter
what the setting of the squelch control
(even with the antenna removed). Further,
if on CTCSS tone squelch once the squelch
opens with a signal having the correct tone,
it remains open even after the signal goes
away.

I have done a hard reset on the radio and
the problem continues.

The Firmware version in my VX-1R is A102.

I have contacted Yaesu Tech Support and
they blame it on the ADMS SW and say to
call RT Systems. I find this intereresting

since I did a hard reset and the problems persists. I guess you can do things through the serial interface that even a hard reset won't recover from.

I will be calling RT Systems later today to see what they have to say. They had no one available since Friday that knows anything about the VX-1R or the ADMS SW.

You're right Bob. I think one's reluctance to say much here is that alot of people are afraid of the heavy duty scrutinizing and flaming that goes on! I get alot of replies directly to me instead of directly to the group, where it would help everybody!

Personally I could care less about the "flamers" as they are the type that don't learn from theirs or others mistakes anyway .. kinda like the mosquitoes up here in WI. .. they are just there!

Keep up the good work Bob ..... 73 de KB9JAI .... Dwight

Hello Ted!
Me thinks thou hast missed the boat by about 12+ years!
I used to live in Vineland, and when Cable-TV was coming in hot and
furious, I decided to ride around the area, check for TV towers by a
house that had the familiar Cable line going into it, and 'offer' to
dismantle their obsolete tower for them for no charge! I believe I
acquired over 30 towers like that! Which I then sold to people up here
in No. Jersey. Around the Middlesex/Union Counties areas.
Yepper.....I made big bucks those 2 years!
Try doing what I did. There may be some left.
Regards,
Brian

Type Approval (Acceptance) isn't required for CAP use. That falls
under military jurisdiction, as does MARS operation, and the military
isn't subject to FCC authority.

To get the factory approved, IE won't void your warranty, mod for
MARS/CAP, send a copy of your MARS or CAP permit to Yaesu
USA, and they will mail you the mod.

I have a Yeasu 727R(A) That is still NIB that I bought new at the Orlando Ham Fest in 1990. Dumb me, I did not know that the "(A)" meant European version. It has sat in the box on my shelf for the last 7 years. Question, short of sending the radio back to Yeasu, can the radio be changed from the European 10 and 20 khz spacing to US spacing of 12.5 khz?

Thanks

DF

Dan:
Sounds like your getting return noise from a nearby TX. Go around
your site and check
every TX and see if they have an isolator on the output of the TX. This
will
reduce the retransmission of other signals. Some sites require that all TX's
have at least on Pass cavity on the output to reduce transmitter noise.
Sometimes you can't solve these problems and you have no choice but to
move to another site.

Before taking such drastic measures, take the repeater
off site and re-hook it up to and antenna and check for de-sense. Try to get

the antenna as far away as possible to the repeater. This will separate a site
problem from an internal repeater problem. We don't live in a noise free environment and some noise cannot be eliminated. High density TX sites raise the background noise level by many db's, this is caused by noise from the output transistors which falls off channel. Proper engineering can make site relatively clean, but requires money to be spent and most companies don't want to do anything when it doesn't directly affect them.

CHINA HAM NEWS 11/11/97: EME Schedule

Contributed by Lars Melin, SM0KAK
Member, Tsinghua University Amateur Radio Club, Beijing, China

Edited by Rick Niu, BD1QL
MBA '99, Columbia Business School, New York, NY
xn6@columbia.edu

BY1QH will be QRV on 144MHz EME at 1300-2300z, Saturday, November 15, 1997.

1400-1600z CQ
1600-1700z Listen around
1700-1900z CQ
1900-2000z Listen around
2000-2100z CQ
2100-2200z Listen around
2200-2300z CQ

BY1QH will always call CQ on 144.120MHz, using two-minute timing, with BY1QH transmitting in the first period. BY1QH plans to stay on 144.120MHz the full even hour, and stay there longer if someone is heard at the end of the hour.

During the contest, BY1QH will be QRV on a borrowed mobile phone: (86-10) 9085-4674.

So far BY1QH has worked SM5FRH, SM5BSZ, SM2CEW, KB8RQ, and W5UN.
If you want to see some pictures taken at BY1QH just before the first leg of the ARRL EME contest, take a look at the homepage of PA3DSS:
http://www.horizon.nl/~tdekkers/by1qh/index.html.

CHINA HAM NEWS is available for unlimited, appropriate distribution.

Hello Joe,

Very useful information to keep in a technical folder on 2 mtr rigs.
However, I thought most power supply problems generated a 120 Hz
rather than a 60 Hz hum.

Q. - Is it totally beyond the realm of possibility that you could get
a 60 Hz (or even a 120 Hz) hum from some sort of common path through a
microphone ground wire? Especially if there is an MFJ-1200 series
microphone switch in the circuit for connection to a TNC?

: This is a flea-market item. Look in the rec.radio.amateur.swap
: newsgroup, they run $125-150 asking price there.

This is good advice, IMO. I bought one of these about a year
ago at around that price; even with sunspots down I've had some
fun with it in the car, and even bagged a couple of new
countries with it. If you want one, find it quickly before
propagation gets much better--the price will go up with the
sunspots, I'm guessing.

Source record: 162146

--

I'm looking for a full-featured, multi-band, multi-mode, VHF transceiver. I want it to at least cover 6 meters, 2 meters, and 70 cm. And I also want FM, SSB and CW modes.

Does anybody know if such an creature exists? Any recommendations?

This is my first radio, and I don't want to make a mistake. I know there are others out there with a lot more experience with the radio market than I have, and can hopefully lead me in the right direction.

By the way, this is going to be my primary radio, so I want a new radio, not used.

Thanks for your assistance. <email replies welcome>

We had the same symptoms on one of our 2M repeaters and, in the end,
the problem was traced to the antenna. Although the antenna was a
good match and showed very little reflected power, it was apparently
bad inside the radome and was acting like a spectrum generator when
the transmitter was on. Much of the generated noise was within the
passband of the receiver cavities and severely desensed the receiver
while creating one hell of a snap-crackle-pop noise as long as the
transmitter was on. It was sort of like the razor wire problem
above except our IM generator was in our own equipment.

I have the logging program AEA LogWindows, version 3.0,
which is a fine logging program.

After undergoing a callsign change, I tried to go into
the program and change my callsign, with no luck.

I'm told AEA is out of business and can no longer help
me.

Anybody out there know how to change callsigns in that
program? (By the way, I am the original purchaser of the
program).

I have an AOR8000 for sale at $480 (shipped or pickup in SF Bay). This is CE certified and is defaulted in the UK bandplan (default can be changed via computer interface or keypad). It is less than two weeks old and is unblocked and the serial number is 53609. Accessories included are four 1.2v 700mA AA batteries, rubber duckie antenna, metal belt clip, hand strap, manual, boxes, and ciggarette lighter adapter. There is no wall adapter. Unit is fully functional. I am selling so I can buy a different radio. Please reply to ww3@ibm.net if interested.

I am really impressed with the overall quality of the responses on this subject, with many good ideas. One thing that no one mentioned was a frequency analysis. That is, compute the intermod products of every transmitter on the site with your own transmitter. This is probably not the problem, but is possible, especially if one of the other transmitters is on 100% of the time.

If you are looking for a source, such as the 19 inch loop of barb wire, you could use a separate receiver with a good bandpass filter, and then "sniff" to see if you can find a hot spot. If you can't find a hot spot, that would point to the antenna, or very near it.

Good luck,
Richard, KA0DXM

2732. FS: Kenwood TS-690S

I Have a Kenwood TS-690S with internal automatic
antenna tuner for sale. It was purchased new 11/17/92.
The SN is 40300220. I purchased it earlier this and am the
second owner. It is in like new condition with manual
and original box. The case has one small/light scratch
on the top left rear. There are NO optional filters.
The original owner replaced it with a new Kenwood.
The reason that I am selling is that I am moving and
will not be able to use it where I'll be living.
It's a great rig and as far as I can tell works perfect.
Asking price $1000.00 Bank check or postal money order.
I'll pay shipping. If you want it sent COD, I ask that you
pay all shipping cost.

Dan ,we fought a similar problem. Our noise was a loud crackle-pop that
no amount of input signal would overcome.
We tried bonding the tower joints in the proximity of our antenna,
replaced the antenna and feedline (350' of 7/8)and still noise
we moved the antenna 50' up on the tower and no more noise. The RF was
exciting something on the tower that was producing the noise. (rusty
joint,clamp,nearby antenna or something like that)

I would never recommend R-7000.

VERY VERY bad mechanical quality.
^^^^^^^^^

Although it met the electrical specification, Cushcraft continues to
sell antennas held together by cheap hose clamps, made of thin wall
poor grade aluminum, and crappy documentation to boot. I am not directly
familiar with the other short vertical products (DX88, DX77, etc.)
but doubt that I'll buy another Cushcraft product based on the miserable
quality of the R7000.

I owned a High-Gain DX-88 for several years at the end of the peak of the last sunspot cycle. Very easy to put together; never had any problems with the construction...very good quality. Excellent antenna for 10, 12 15, 17 and 20 meters. 40 and 75 were generally, but not always handled better with a G5RV. I did NOT use any radials. My general opinion of the antenna is that the G5RV is a much better value for the dollar if you've got the space. There are some signals, however, that sounded MUCH stronger on the DX-88 on 10 - 20 meters.

Good Luck & 73,

Jim Nitzberg WX3B

Hello Folks,

My name is Don Barba. I am the Administrator of RIME, the
(RelayNet International Message Exchange(tm)), Network.

RIME (est. 1988), is network of world wide independent BBSs that
exchange e-mail. Messages are placed into subject areas called
conferences, each having a Conference Host (CH). Several areas are also
supported by vendor technical representatives who assist users.

Every message is viewed by the team of diligent CHs (moderators). Thus
insuring that RIME's rules for "excellence of content", and decency
standards, are being met by every user.

RIME is a true "family network". The standard is not what one might see
and hear on prime time TV, but rather what one might see and hear from a
teacher in a classroom. RIME's goal - is any child may stray into any
conference without being subjected to things considered obscene, abusive
or offensive. It is this high quality consciousness that makes RIME
unique.

I am inviting you to join the RIME Network. RelayNet(tm) is now
available on your desktop, from any NewsReader. Registration for access
is as easy as pointing your Browser at http://www.relaynet/org
and completing the ONLINE NNTP application. The RelayNet(tm)
website has additional information about RIME, and allows you
to read our conferences in real-time so that you can see what we
are about.

You may contact the following for more detailed information:

I have a R7000 and think it is well made. If I were making my own
antenna I might make it stronger in the center section ... for ease in
raising and lowering the antenna.

: Well Bill,
: That calculation may may be close for your electric range, but I have
: yet
: to see an amplifier that is 100% efficient.
: --
: Rob

: Rob Bienenstein (W8TX) http://members.tripod.com/~rob_1/equip.htm

Well Rob,

Lets do a little scenario. Take the 13kW continuous offering for example. Now say it only runs at 50% efficiency. We are now up to 26Kw. Throw in another 4kW to cover other losses and we have a grand total of 30kW.

At my house, with a 200 amp main, each leg runs 121V-122V no load. With every thing in the house that uses electricity turned on and and a few extra 500W floodlamps plugged into spare plugs, 1000W metal halide flood, air compressor and a 2hp deep well jet. Oh, I ran the hair dryer also. The voltage drops to a minimum of 116V while drawing 137A. My electric company was kind enough to use 2/0 copper for the connection to their secondary. That gives me 232V phase to phase. 30,000W/232V = 129.3A This still leaves 70.7A to run the rest of the house on. An amount sufficient to run the rest of the house under normal conditions.

Electricity wise, I don't see any problem. Actually, it may turn out to be the least of all problems. Of course you may put a kink in the theory of divirsity that the electric company uses in figuring distribution transformer kVA, but that is their problem. They'll just have to use a

larger distribution transformer if you contest a lot.

You can tie them together by putting a large (100 Amp) diode in series
with each supply then tying the output's of the diodes together:

```
- + D1 D2 +
- ----PS1-------->|-------o---------|<---------PS2------- -
```

Where PS1 = power supply 1, PS2 = power supply 2 and o = the positive
output.
An tie the minus (-) sides of both supplies together and to
ground/common/whatever...

OK, next possibility from another would-be power supply combiner.
I have three 5.5v 200 amp supplies, I'd like to wire them in series for a 12-14v 200a supply (I am assuming I can crank the voltages down - target 13.8vdc I guess - they are marked ADJBL supplies)

How do I do that?
Do I need to isolate the chassis from one another?
Is there a serious concern about RFI from these things?

Thanks & 73, DavidC AA1FA

Hi Dan,

I think they may still be selling a new one at my local radio
shack for $150. You wouldn't happen to have any cheap 2 meter equipment?

73's N9syw

All good ideas. It would be helpful to know the frequency of the hum.
Not the EXACT frequency, just roughly what tone is it. 60hz? 120hz? or
is it a higher tone? Once you know the tone you can make some 'first'
guesses. Everyone has their own approach to trouble-shooting but here
is the way I would go on such a problem:

60hz - coupled noise typically into a high impedance circuit like the
microphone. Transformer saturation, equipment location, lead
routing...

120hz - power supply ripple. Check raw voltage potential. Does the
supply have an SCR type pre-regulator?

higher - RFI. Inline filters, lead length, location, grounding,
circuit improvements (bypassing etc).

Just a wild guess but it sounds like RF is getting into the supply and
causing some problem. If you observe the DC voltage going out of
regulation (increasing) when you key up i'd suspect RFI. Try moving
the supply location and cord length and/or a bit of inline filtering
to and from the unit. A review of the supply schematic and component
layout would help if you are capable of identifying areas that might
be susceptible to RFI. Magic beads, and small bypass caps can do
wonders in the hands of someone that knows where to put them...

In Europe, three-phase is readly available. Power is distributed locally by a three-phase 415V Y-system, and individual houses get a 230V AC feed from one of the phase conductors and neutral. Neighboring houses are connected to different phases to roughly balance the neutral current. Large buildings and light industrial users get all four conductors. In countries such as Sweden which have a history of large electric heating demand, even individual houses have three-phase supplies.

I was able to program a memory with a 2 meter xmit
freq and a 70 cm rcv freq. At least all indications
were that it was stored correctly. However when I
attempted to xmit using that memory it did not.
Instead the 2 meter frequency was displayed but
flashed. I am told by RT Systems that this indicates
that the PLL is going out of lock.

2776. Re: 2M repeater problems

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-11 00:00:00 UTC
From: kd8cp@rocketmail.com
Message-ID: <879253539.18423@dejanews.com>
Source record: 162210

Sounds like a tough one. If you have access to a spectrum analyser, check to see if the noise is really on your input freq. or if it's just broad band noise. It might help you know where to look.

Some things you might try; You mention your antenna is not grounded. I assume you are talking about the center of your coax. Make sure you run this thru a ligtning arrestor. Ground everything. That means everything, and don't just use a wire, use flat copper or braid. (I used #12 wire on mine and I still had problems with the commercial FM station on the next tower coming in on my audio. 1 1/2" flat copper ground straps fixed it.)

Replace your power supply with a battery to make sure the noise isn't coming from there. I believe the finals will run off 12V at reduce power, probably 5- 10 watts. Check with the manufacturer to be sure, but if it will, that eliminates 2 supplies which could be making noise at increased current.

Get some clamp on torroids and put them on all your cables except the coax.

Why waste time to determine if the average house will run an amp this
large? It is NOT legal to run in the US for any ham. Unless you crank
it way down ... 1500 w output = legal max.

>>Looking for increased band reception on IC 3200a. Currently it is 140-150 / 440 -450. Have been told low side can be increased to appox 130 - 170 but no one seems to recall what is entailed.... An help or information would be greatly appreciated. Thanks !<<

According to experiments that I and others performed in the mid 1980's, the 3200 can only be extended to 154 MHz in the 2-meter section. None of us had any luck at all extending the coverage of the 70 cm section beyond the 440-450 MHz factory coverage. We tried all possible diode initializing patterns.

Yes, it is in series, and a suitable value would range from a low of about
100 mH up to about 10 H. (Obviously we're talking about iron core chokes
here.) One cheap source for this sort of filter is to use the filament winding
of a heavy power transformer. Or you can wind one on a powdered iron
core. Pay attention to the winding resistance, or you could be introducing
too much voltage drop with the current draw of typical amateur rigs.

I agree, but make sure that both supplies are adjusted to the same
voltage, OTW, one becomes the predominant "pump".

Source record: 162220

So don't you think that this kid is a big joke or what? He faked his identity in the newsgroup while using his real name and email address to send me the exact same piece of garbage via email.

Now we all know that, without having to do a whole lot of investigation, xyz@harts.org is Mr. Wong Wing Kin. He is a student from the University of Science & Technology in Hong Kong (@stu.ust.hk). Thanks for telling us all! I am sure that I'll let the whole world know his callsign once I find that out.

He dislikes Hams in Hong Kong and around the world. Likewise, he fakes email his address by using xyz@harts.org (his real email address is ac_wwkaa@stu.ust.hk). When he is being confronted, he gets so defensive that he starts to call names. These have proven that he is either a disgruntled Ham or a right out loser in general. =20

Well, maybe my help to the newsgroup is indeed proving that I am an idiot in Mr. Wong's eyes. However, my intention is good and my reply is not without merit. It is he who started out insulting other people in the first place and that by itself is enough for us to really watch out for.

In closing, I suggest that Mr. Wong comes out and make a public appology with his real identity. Be a bright person like many people here in the newsgroup because you don't need to live in the dark by insulting people and have your own identity concealed. There are great many people here would like to read your positive and valuable inputs, and share ideas with you. If you've found yourself in a wrong newsgroup, please make a switch. It's ashame that Mr. Wong, as a grown man, needs so much to be done to get mature.

Source record: 162027
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.misc

DJ 580-T with 7.2v standard battery, charger, antenna and manual. Radio has been modified to receive AM aircraft and full 800mhz/cell band. It is in very good operating condition, but has seen a lot of use, so about half of the keys have the characters worn off, the plastic cover over the lcd has wear marks on it, and the original owner scratched his driver's license number on the back cover.

None of these wear features affect the operation of the radio. It transmits and receives very well, and all of the other functions such as CTCSS, DCS, and memory dialing work properly.

Price is $225 plus shipping charges.

Thanks.

Mike - WD4SGU

Regardless of what many others say, I think the best place to hook up the radio is negative lead directly on the engine block and the positive lead on the engine starter (or where ever the positive battery cable connects to). Crimp a large circular terminal lug on the end of each radio power lead for good mechanical reliability. The cars huge battery cables are so low in resistance that it's much like connecting to the battery itself, and you have the added protection of not harming the radio if the engine's neg. battery cable fails. But the part I especially like is not having those messy little wires at the battery terminals interfering with the car's battery cables making a good connection to the battery. Those little wires are always corroding at the battery and not very reliable.

2795. How well does DSP work?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-12 00:00:00 UTC
From: XSavageFam@paonline.com
Message-ID: <346a284c.896842@news3.paonline.com>
Source record: 162030

A friend showed me his new Kenwood TS-570. I was especially interested in the DSP, so he showed me how that function worked. While the bandwidth reduction seemed to work quite well, I was surprised and rather disappointed in the way the noise reduction algorithms worked. Especially when in the NR 2 mode, there was a constant "burbling" noise (even that's not a good word, but I can't describe the sound) coming from the speaker. This was quite distracting.

Is this typical or normal for DSP noise reduction? Is it something you get used to? I was thinking of selling my TS-850 and getting this new rig, but not any more. How about add-on DSP units like the Timewave products? Are some brands or models better than others? I'd like to hear your experience and opinion with these add-on units, posted to this newsgroup.

Thanks!

> Don, VE3DGE

Hi Don...

I have the SGC-230, and as I have understood it (and am using it),
the dipole is connected with one side to the output terminal of the
tuner, and the other to the ground terminal of the tuner... The
unit is fed with 50 ohm coax at the normal connector on the pigtail
from the tuner..

My dipole is 60' on a side, and I am getting unbelievable
results on 10 thru 80 with my 100W TS-830.. I cqn get out on
160, but have a lot of RF on the rig.. I am in a temporary
operating location however, and don't have a ground to the rig
at this time..

I get consistently good reports on all bands.. THe performance on
75 has been unbelievable..

Good luck !!

I use the Timewave 59Y -- it's the unit that fits inside a Yaesu SP-5 cabinet. I find it makes listening easier. It is not the difference between copy and no copy, but the difference between a pleasant rag chew and the tension that would otherwise come from the concentration necessary when the bands get noisy.

It's good with noise, great with heterodynes, and the agc function is often nice if a bit confusing (confusing in that sometimes it makes things much better, other times much worse). I do not use the high pass/low pass adjustments much as I already have good filtering, IF width, IF shift, etc., on my FT-1000.

I also use it for packet. I haven't done many comparisons in packet mode yet -- it just seems to be on unless I specifically want to run with wide open filters to hear who's not on frequency.

2810. ADMS 2d software for the 8100! (got it today!)

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-12 00:00:00 UTC
From: "Alan K. Adamson" <ne1h@ne1h.radio.org>
Message-ID: <64ehe8$dbs@news.gwinnett.com>
Source record: 162045

All,

I just got my adms 2d software for the 8100... Very interesting. I'm looking from some "template" files from other 8100 users. It would appear that the software, looks at the "template" file that you have to download from the radio the first time, for each upload to the radio. The Help file says something about getting freq. ranges, etc from the template file. I suppose that other US 8100's will be the same or similar with this "template" file, but other countries (and other freq ranges :-)) may be different and it may be a way to unlock the receive coverage of the radio.

Anyone else have any experience?

Alan Adamson

>
> Don, VE3DGE

Don,

I don't have personal experience with that tuner, but what matters is
the tuning range for the load. It shouldn't matter whether the load is a
single wire or a feedline. What matters is the range of R & jX the tuner
is capable of matching. If those specifications are available, you can
calculate the antenna feedpoint R & jX and then calculate the Z
transformation due to the feedline to see what R & jX the tuner will
see. If the load at the tuner has a value of jX beyond the tuner's
range, you can add the opposite type of jX in series or parallel with
the output of the tuner.

2815. Essay Question

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-12 00:00:00 UTC
From: "Edward, III Dickinson" <eddick@worldnet.att.net>
Message-ID: <64cgop$od4@bgtnsc03.worldnet.att.net>
Source record: 162050

The following table is contained in an article in October 1997 QST, 'Official Journal of The American Radio Relay League'. The article, "What's New About the FCC's New RF-Exposure Regulations?", by Ed Hare, W1RFI, is on pages 51 and 52.

Table 1
Power Thresholds for Routine Evaluation of Amateur Radio Stations

Band (Wavelength)	Transmitter Power (W)
160m	500
75m	500
80m	500
40m	500
30m	425
20m	225
17m	125
15m	100
12m	75
10m	50
6 - 1.23m	50
70cm	70
33cm	150
23cm	200
13cm and up	250

ESSAY QUESTION

Compare the frequencies aligned with lower power thresholds with those which may be useful to Low Earth Orbit satellites. Include in your discussion the implications of non-structured communications verses a potential preponderance 'organizationally prepared' information. Discuss the ramifications of this with the potential dampening of freedom of communication throughout the world. Additionally, discuss the idea of vertically integrated information processing entities dominating the RF Spectrum. References to other recent restrictions on the airways, may be included.

As you see fit, please post this 'essay question' where it may be viewed by Radio Amateurs and interested others.

'Only the Paranoid Survive'
- Andrew Grove

'The price of freedom is eternal vigilance.'

2818. Panasonic RF-2600 SW Calibration Adj?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-12 00:00:00 UTC
From: rbortell@ns1.wsg.net
Message-ID: <3469bf1a.11991934@news.empireone.net>
Source record: 162053

I have a Panasonic RF-2600 receiver with a digital frequency readout (in fact, I've had it for more years than I care to think about). There's a "SW CAL" knob which you use to calibrate the frequency shown on the readout to the station you are listening to. When it was new and I was younger, the readout would be calibrated to the station with the SW CAL knob pretty much in the middle of its range. However, over the years, something has drifted or changed, so that now in order to calibrate it properly, I have to turn the SW CAL knob all the way to the left. It won't be long before the station is out of the SW CAL knob's range.
If there's somebody out there familiar with this radio, can you tell me if there's an adjustment somewhere in the radio to bring the thing back in range?

You need to limit the current to 10%-20% of the batteries ammp/hour
rating (for nicad and probably most others). Heat damages batteries.

You can limit the current with a LM317 voltage regulator, as long
as you run less than 1 amp. Radio Shack has them. You can wire them
up with one additional resitor to make them a current regulator.

>Oh, and my meter is unable to measure the amperage over 600MA, what
>inexpensive metering setup would be good to monitor this battery - the goal
>is to keep a trickle charger (the Micronta?) on it.

Jerry rig a 1/10 ohm resistor (you could use coil of wire).
Put it in series with battery and charger. Measuring voltage
across it will tell you the current.

2820. FS Standard C528A

Newsgroup: rec.radio.amateur.equipment

If your one hour program is any good, why dont you go to one of the
local AM radio stations and see if they will run it for you. That way
someone will really listen to it.
Another option is to do it on your CB radio, even though illegal, the
band is trashed and no-one cares.
Otherwise you will probably get caught as all the other radio spectrum
is very valuable and monitored quite thoroughly.

If the FCC would allow broadcasting to the public by hams, their pirate problems would be solved. Who wants to listen to a bunch of old farts talking about how great their rig is and what the good ole days were like when they didn't have all these nocode techs? On top of that, a night listening to the chaos on 3950 and anybody would be scared away from hamming.

2830. Newer VX-1R MODS

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-12 00:00:00 UTC
From: Luca@monoski.com
Message-ID: <879314470.18838@dejanews.com>
Source record: 162082

I liked my VX-1R so much that I bought another one.
I was surprised to find out that the the extended RX and TX mods no longer works as is on the latest serial number radios.
The problem is simple: somebody must have noticed the ability to receive the cell phone band , and they removed diode D2006 on the logic diagram which connects to JP0 and JP1 and the jumper scan line on the CPU.
I reinstalled the diode and shorted jp0 and jp1 and it works as expected.
shhh! Don't let the FCC know .....
Bye
Luca

DavidC (davidc@bit-net.com) wrote:
: I recently acquired a used gel-cell battery. It is a large (car battery
: size).
: It measured just under 9v when I got it. I connected a 2.5A 13.8v Micronta
: PS I had laying around and started the charging process. After several
: hours the battery was up to 11v.
: My concern is that the PS is getting very hot, should I have diodes in the
: charging line or something to protect the PS, or is the process of bring
: the voltage back up in the battery just unusually taxing on the PS?

A gel-cell battery of that size can draw a fair amount of current-the
current will go down when the battery is near full charge.

: Oh, and my meter is unable to measure the amperage over 600MA, what
: inexpensive metering setup would be good to monitor this battery - the goal
: is to keep a trickle charger (the Micronta?) on it.

One way to measure high current is to find a high power low ohmage
resistor(under 1 ohm is best, to reduce voltage drop).
Put the resistor in series with the battery, and put the meter across
it:simple ohms law will allow you to determine the current.
If you can't find a suitable resistor, then use a length of wire...if a
digital meter is used, copper wire may do, but if a analog meter used,
then resistance wire may be needed.

: Thanks in advance for your help!

I'm changing my tune after reading an ariticle in this months Fists newsletter.
DO connect it to the chassis of the car and the reasoning behind this is, if you don't, the shielded conductor of the coax can become the ground cable and so can the chassis of your radio. Live and learn!

Haha.....it's really a big joke that this helpless guy(VR2UE) is so naive that he believe everything he read.....he is very lovely I think, but it's a pity that he still miss something----a brain.

How come a person intentionally hide will use his real name? How come the so-called exactly the same is not EXACTLY the same? Who is kidding?
I only wish he was not so poor that he mail to himeself....
Or if innocent is involved...it is regretful.

So if Mr.Ho wish to contact me or find someone to talk to pls mail me at xyz@harts.org.

No more noise here, it's enough

David Ho (AF4BH/VR2UE) <davidho@one.net> wrote in article <Pine.LNX.3.95.971111093104.3843A-100000@shell.one.net>...

So don't you think that this kid is a big joke or what? He faked his identity in the newsgroup while using his real name and email address to send me the exact same piece of garbage via email.

Now we all know that, without having to do a whole lot of investigation, xyz@harts.org is Mr. Wong Wing Kin. He is a student from the University of Science & Technology in Hong Kong (@stu.ust.hk). Thanks for telling us all! I am sure that I'll let the whole world know his callsign once I find that out.

He dislikes Hams in Hong Kong and around the world. Likewise, he fakes email his address by using xyz@harts.org (his real email address is ac_wwkaa@stu.ust.hk). When he is being confronted, he gets so defensive that he starts to call names. These have proven that he is either a disgruntled Ham or a right out loser in general.

Well, maybe my help to the newsgroup is indeed proving that I am an idiot in Mr. Wong's eyes. However, my intention is good and my reply is not without merit. It is he who started out insulting other people in the first place and that by itself is enough for us to really watch out for.

In closing, I suggest that Mr. Wong comes out and make a public appology with his real identity. Be a bright person like many people here in the newsgroup because you don't need to live in the dark by insulting people and have your own identity concealed. There are great many people here would like to read your positive and valuable inputs, and share ideas with you. If you've found yourself in a wrong newsgroup, please make a switch. It's ashame that Mr. Wong, as a grown man, needs so much to be done to get mature.

Our club did a bunch of the UHF Micor's a while back. I use one on 440. You will have to re x-tal the rig, and do an alignment as per the service manual. Thats all you need to do.

I have the Astatic D-104 microphone mounted on the T-UG8 stand (with built-in amplifier).

1. What is the impedance of the D-104 element?
2. What is the small slide switch mounted inside the base with positions marked "E" and "R"? How do I set it? I intend to connect this microphone to my Yaesu FT-840 HF Transceiver (requires 500-600Z impedance input).

Thanks for your assistance.

%20mods.htm"

Where can I find the best source for the most complete modifications for
the FT-50rd? I would appreciate anyone who could tell me. I
have the mars/cap mod but heard that here are much better ones. Do
you need that programing kit to do the cellar mod? I got one but
it's not too clear.

Thanks in advance,

Bob........

We had a similar problem. It turned out to be the antenna. We had one of
these fiberglass "big stick" type antennas, it was side mounted on a
tower at the 300' level with out a top brace on the antenna. Apparently
what happened was the antenna wiped in a heavy wind and the top hit the
tower. Inside those antennas are multiple stacked antennas consisting of
short pieces of hard line cross connected for phasing. What happened was
that when it hit the tower it broke one or more of these connections and
we lost part of our antenna. Surprisingly the SWR didn't change much.
Our gain was of course lower but we couldn't easily tell that. But when
the antenna moved we would get noise as the broken connections made and
broke contact. Replacing the antenna and putting the top brace on cured
the problem. I'm told that the problem of breaking connection in that
type of antenna is not that uncommon. Hope this helps or at least
doesn't scare you too much.

I assume the batt. is 12 V so IMHO if it only came up to 11 in 2hrs at 2.5 amps, you have a bad batt.

Go to yahoo and do a search on FT 50 and variations. You will bring up
lots of pages (one even had photos) of mods.

In short you only need melt a blob of solder and heat up a resistor hot
enough to remove it. Reset the radio and you can recieve cell.

It takes about 10 min. Very simple.

Your welcome in advance.

That pretty much limits you to the Yaesu FT736R with the optional
6m module. Good radio. The design is getting a bit long in the tooth,
and the user interface is a bit busy, and it only receives on one band
at a time (no dual receive), but it is a solid performer and is widely
used by the satellite community.

If you can live without 6m, there are some other choices, but the
FT736R is an old, and well debugged, workhorse which will deliver
the goods for you.

The element itself is high impedance. Older D-104s had a crystal
element with a 10k impedance. Later models had a ceramic element,
but the impedance was still up around 10k ohms. Yours has an
amp, though, so element impedance is a moot issue.

>2. What is the small slide switch mounted inside the base with positions

Can't help with that, my D-104 is the old unamplified crystal element
version.

Subject: Conversion of MICOR UHF to duplex mobile (long!)
Organization: NeoSoft Communications Services -- (713) 684-5900
Distribution: usa
Date: Thu, 5 Nov 1992 22:15:16 GMT
Message-ID: <Bx9KHJ.IDz@NeoSoft.com>
Summary: how to make standard UHF micor mobile into duplex mobile
Lines: 172

Why would you want a duplex mobile, you ask? Once you've experienced it,
you'll never go back to jap-trac's.

This describes how to take a standard UHF micor mobile radio and make it
work as a full-duplex mobile radio. Since Texas is high-in, low-out on UHF,
this also includes which cap changes are required to make the radio receive
below 445 MHz.

There are diagrams referenced in this text. If you are unable to figure out
what to do without the diagrams, mail me at jreese@sugar.neosoft.com and I'll
try to get you a copy of the diagrams.

Jim Reese
WD5IYT

Conversion of Motorola MICOR UHF Radio
For Use as a Duplex Mobile

This conversion is not for the faint-hearted. Make sure you are very
familiar with the operation of the Micor radio before attempting this
conversion. As with all modifications of this type, insure that the radio is
operating correctly BEFORE any modifications are made. It is much easier to
fix it before you hack it up. Do not attempt this conversion without a service
manual. You need the PC layouts and tune up instructions from the service

manual in order to perform the modification.

Useful Motorola Part Numbers

68-81015E70-H Manual for UHF MICOR
KXN-1024 5ppm Channel Element for UHF MICOR
KXN-1029 2ppm Channel Element for UHF MICOR
KLN-6210A PL Encode Reed
TLN-8381A PL Decode Reed
66-84690C01 Contact Removal Tool for MICOR plugs
TKN-6458A Large Fuse Holder for Primary Power (40A)

Crystal Ordering Information

When ordering crystals, specify the KXN-1024A channel element number. Always order the crystal on the RECEIVE frequency. If your radio will be a high transmit unit, the crystal will be LOW side injection. For low transmit radios, order the crystals on HIGH side injection. This will flip the transmit offset to the other direction.

Conversion Instructions

Step 1:

Make sure that the radio is operating properly by tuning it up with one of your crystals before any modifications are made. If you are using the radio as a high transmit unit, you must make the capacitor changes in step 2 for the radio to work properly.

Step 2:

If your radio will be receiving below 445 MHz, change C117 to 27pF, C119 to 39pF, and C125 to 12pF on the receiver board. This is not necessary if the radio will be receiving above 445 MHz.

Step 3:

You must make some modifications to the control board and the receiver audio/squelch board in order to make the radio full duplex. First, remove JU-905 on the control board. Next, jump pins 1 and 4 of the audio squelch board. On the later version audio squelch board, there is a place for a jumper (JU-202), on earlier units, just make the jump with wire wrap wire.

Add capacitors at the following points on the audio squelch board. Add a 100pF cap between P903-5 and P903-6. On IC-201, add 15pF caps between pins 3 and 4, and between pins 3 and 5. Add 100pF caps between pins 6, 7, 11, and 13 of IC-201 and ground. On IC-202, add 15pF caps between 5 and 9, 5 and 13, and a 33pF cap between 5 and 15. This makes the board less susceptible to RF. Keep the leads on these caps as short as possible.

Step 4:

Carefully remove the front casting from the chassis. This is done by removing the four screws top and bottom as well as two screws on the control head plug. This is kind of tricky, so be careful to remember how you got it apart so you

can re-assemble it later.

Examine the Power Amplifier section of the radio and notice the miniature connector which connects the output of the PA to the circulator. Unplug this connector from the circulator using a needle nose plier or hemostat.

Turn over the radio and remove the power control board. This will expose the top plate of the circulator. Remove the circulator by carefully removing the sensing wires which connect to the power control board and the two screws which hold the circulator in. You will have to unplug the receive antenna coax from the preselector unit in order to remove the circulator. Set the circulator aside for later modification.

Step 5:

Mount a BNC chassis mount connector on the top side of the front casting on the side opposite from where the lock is located. This will be the receive antenna connection. Be very careful to locate this connector so that it does not hinder the operation of the latch mechanism. Attach a small coax to this connector and route it to the receive antenna jack on the preselector unit. Drill a hole in the front of the radio chassis to pass the coax. This will be obvious once you have examined the unit with the front casting removed.

Step 6:

This is the toughest part of the conversion, the circulator modification. Remove the cover from the circulator unit. You will notice that there is a circulator, an output filter, the antenna switch, and the circulator reject load. There are three trimmer caps, only one of which has an access hole in the top plate. Measure and drill the top cover so that you have access to all three trimmers from the outside. This is necessary because the cover affects the tuning of the circulator. After drilling the cover, set it aside.

You must now remove the antenna relay. This is a small relay on the right side of the circulator. The small dark red or green rectangular unit with a wire coming from the relay is the reject load for the circulator. This is a ceramic 75W 50 Ohm resistor. The relay switches the output port of the circulator between the receiver and the reject load. Be EXTREMELY CAREFUL when soldering on the reject load, as the top terminal can break off of the ceramic very easily. I suggest cutting the wire from the relay, removing the relay, and then removing the wire from the load resistor. Once the relay is removed, wire the dummy load back to the output port of the circulator which is on the common side of the relay. Refer to the manual for the circuit. The easiest way to accomplish this is with a small piece of teflon coax (RG-188). Run from the circulator port to the reject load. You can solder to the circulator case for the shield on the load end of the coax. Replace the cover on the circulator and reinstall it in the radio.

Tuning Instructions

Before tuning, disable the receiver AFC by soldering a wire from the "AFC OFF" trace on the receiver board to ground. The procedure for disabling the AFC is described in the receiver tuning instructions section of the service manual.

Tune the radio per the Motorola manual. Once you have achieved this, you need to tune the circulator. The following procedure should be followed:

Remove the power control board, and power the radio with a supply having a current meter.

Attach a jumper or clip lead from feedthrough C527 on the Controlled Stage in the PA compartment and feedthrough C536 on the driver stage in the PA compartment. This will force the radio to maximum power output.

Key the transmitter and tune the three circulator capacitors for maximum power output.

Reinstall the power control board, and preset the drive limit pot fully counter-clockwise. Set the power set pot to the desired power output level.

Key the transmitter and tune the center circulator capacitor (the only one accessible from the top of the power control board) for minimum current draw. You should be able to make several Amps difference without affecting the power output.

Turn the drive limit pot 1/4 turn clockwise, or until power just starts to fall off.

That's it. Remember to always set the receive frequency first when setting frequency, as this affects the transmitter also. Set the transmitter with the offset trimmer coil on the exciter board. Make sure that you have adequate cooling space around the PA heat sink fins when the radio is installed. The Micor PA is not easy to fix, and when it blows, it blows big.

Jim Reese
WD5IYT

Instructions for Conversion of Motorola UHF Micor to Repeater Service

This modification is not for the faint-hearted. Be sure you are very comfortable with the operation of the MICOR radio before you attempt this modification. A thorough understanding of the way the MICOR radio and control system works is absolutely essential for the success of this conversion.

Modification Notes

Whenever "Molex Pin x" is mentioned, it refers to the Armadillo Standard connector. This is a small, 9 pin Molex connector which serves as the interface for all of the Armadillo radios. Use a Female connector on the radio end. The standard pinout of the connector is:

1 - Ground
2 - Receive Audio Output
3 - n/c
4 - Transmit Audio Input
5 - COS Output
6 - PTT Input
7 - n/c
8 - PL Decoder Output (Sense)
9 - PL Select Input

The COS output and PTT input are open-collector to ground signals. Pin 8 goes to +9.6 V when PL is decoded. Pin 9 is ground for PL, open for Carrier.

These modifications allow "PL and Squelch" operation. This means that when in PL, the normal squelch circuit still operates. This avoids long noise bursts upon unkeying.

If using an Advanced Computer Controls controller, the signal at pin 8 is run to the "PL Sense input" on the controller. It will drive this input directly.

Order the crystal on the repeater RECEIVE frequency. You must specify HIGH SIDE INJECTION. If you do not order a high side crystal, the transmit offset will be 5 MHz above the receive frequency, instead of 5 MHz below. I recommend sending the channel element to the crystal manufacturer for temperature compensation. Use a KXN-1024 element for 5ppm accuracy, or use a KXN-1029 element for 2ppm accuracy. Disable the receiver AFC by jumping the appropriate pin of the channel element to ground.

List of Tables and Illustrations

There are several illustrations which are detailed below. Refer to them as needed when modifying or constructing pieces of this project.

Table 1: This is a complete hookup chart for the control head plug and interface board.

Step-By-Step Instructions for Modification

Step 1: Make sure that the radio operates properly BEFORE any modifications are done. If there are problems with the radio, they will be easier to fix before the mods are done.

Step 2: If you are satisfied with the operation of the radio, construct the control head plug per figure 1 and table 1. Use miniature pots and switches inside the control head plug. It is rather tight inside, so be careful to check that the connector will re-assemble before you drill it up. After you have constructed the connector, make the following connections inside the radio: Jump control head pins 3, 8, and 22 to "A+" on the control board. Jump pins 9, 11, and 17 to ground on the control board. Next locate the two feedthrough caps which power the Transmitter Power Amplifier. They are just to the left of the control head plug on the bottom side of the radio. One will have a red wire, and the other a black wire. Jump from the feedthrough with the red wire to the "A+" trace on the control board. Jump from the feedthrough with the black wire to the ground trace on the control board. There is a reverse polarity protection diode on the control board which can be used to make these connections. Next, plug your control head plug into the radio and verify proper operation with the new control arrangement. If there are problems here, troubleshoot them NOW. Do not wait until later, as you may be chasing more than one problem.

Step 3: You must make some modifications to the control board and the receiver audio/squelch board in order to make the radio full duplex and to make preparations for the interface board. First, remove JU-905 on the control board. Then, jump the F1 channel element to ground as described in the Motorola manual. Next, jump pins 1 and 4 of the audio squelch board. On the later version audio squelch board, there is a place for a jumper (JU-202), on earlier units, just make the jump with wire wrap wire. Next, remove a jumper on the audio squelch board which goes from pin 3 of the PL decoder to IC-202 pin 8. This is near the pins which the PL board plugs into. Next, ring from pin 3 of the PL decoder to pin 11 of the audio squelch board with an ohmmeter. There should be continuity here. If not, add a jumper. The later boards have a trace from pin 3 of PL to pin 11 of audio squelch, on earlier boards, pin 11 is unused, and you should jump from PL decoder 3 to audio squelch 11 with some wire wrap wire. Add 15pF capacitors between the following pins on the two

chips on the audio squelch board. Figure 2 details the location of these caps. On IC-201, add a cap between pin 3 and 4, and between pin 3 and 5. On IC-202, add caps between 5 and 9, 5 and 13, and two caps between 5 and 15. This makes the board less susceptible to RF.

Step 4: Next, carefully remove the front casting from the chassis. This is done by removing the four screws top and bottom as well as two screws on the control head plug. This is kind of tricky, so be careful to remember how you got it apart so you can re-assemble it later. Next, examine the Power Amplifier section of the radio and notice the miniature connector which connects the output of the PA to the circulator. Unplug this connector from the circulator using a needle nose plier or hemostat. Next, turn over the radio and remove the power control board. This will expose the top plate of the circulator. Remove the circulator by carefully removing the sensing wires which connect to the power control board and the two screws which hold the circulator in. You will have to unplug the receive antenna coax from the preselector unit in order to remove the circulator. Set the circulator aside for later modification.

Step 5: Procure a BNC chassis mount connector for a receive antenna jack. Mount this connector on the top side of the front casting on the side opposite from where the lock is located. Be very careful to locate this connector so that it does not hinder the operation of the latch mechanism. Attach a small coax to this connector and route it to the receive antenna jack on the preselector unit. Drill a hole in the front of the radio chassis to pass the coax. This will be obvious once you have examined the unit with the front casting removed.

Step 6: This is the toughest part of the conversion, the circulator modification. Figures 3, 4, and 5 detail the conversions. Remove the cover from the circulator unit. You will notice that there is a circulator, an output filter, the antenna switch, and the circulator reject load. There are three trimmer caps, only one of which has an access hole in the top plate. Measure and drill the top cover so that you have access to all three trimmers from the outside. This is necessary because the cover affects the tuning of the circulator. After drilling the cover, set it aside. You must now remove the antenna relay. This is a small relay on the right side of the circulator. The small dark red rectangular unit with a wire coming from the relay is the reject load for the circulator. The relay switches the output port of the circulator between the receiver and the reject load. You must remove the relay and wire the dummy load back to the output port of the circulator which is on the common side of the relay. Refer to the diagram for the circuit. The easiest way to accomplish this is with a small piece of teflon coax (RG-188). Run from the circulator port to the reject load. You can solder to the circulator case for the shield on the load end of the coax. Replace the cover on the circulator and reinstall it in the radio.

Step 7: Construct the interface board using the schematic and board layout in the packet. Install this board on the three unused mounting tabs near the rear center of the radio. These tabs are above the control board. Wire the board up as described in table 1. At this point, the radio will be operating

full duplex, and you should be able to put the radio in PL by flipping the switch on the control head plug to the PL position. Verify that you have +9.6 volts at the 9 pin molex connector PL SENSE pin when the correct PL code is being sent. Also verify correct receive audio gating and COS action.

Tune Up Instructions

Tune the radio per the Motorola manual. Once you have achieved this, you need to tune the circulator. The following procedure should be followed:

Step 1: Remove the power control board, and power the radio with a supply having a current meter.

Step 2: Attach a jumper or clip lead from feedthrough C527 on the Controlled Stage in the PA compartment and feedthrough C536 on the driver stage in the PA compartment. This will force the radio to maximum power output.

Step 3: Key the transmitter and tune the three circulator capacitors for maximum power output.

Step 4: Reinstall the power control board, and preset the drive limit pot fully counter-clockwise. Set the power set pot to the desired power output level. I recommend no more than 50W out for a 75W radio, and no more than 60W out for a 100W radio. The 25 and 45W radios are rated continuous duty at 25W output.

Step 5: Key the transmitter and tune the center circulator capacitor (the only one accessible from the top of the power control board) for minimum current draw. You should be able to make several Amps difference without affecting the power output.

Step 6: Turn the drive limit pot 1/4 turn clockwise.

That's it. you are now ready for major repeating action. Remember to always set the receive frequency first when setting frequency, as this affects the transmitter also. Set the transmitter with the offset trimmer coil on the exciter board. Make sure that you have adequate forced air cooling on the PA at all times during operation. The Micor PA is not easy to fix, and when it blows, it blows big.

Instructions for Conversion of Motorola UHF Micor to Repeater Service

This modification is not for the faint-hearted. Be sure you are very comfortable with the operation of the MICOR radio before you attempt this modification. A thorough understanding of the way the MICOR radio and control system works is absolutely essential for the success of this conversion.

Modification Notes

Whenever "Molex Pin x" is mentioned, it refers to the Armadillo Standard connector. This is a small, 9 pin Molex connector which serves as the interface for all of the Armadillo radios. Use a Female connector on the radio end. The standard pinout of the connector is:

1 - Ground
2 - Receive Audio Output
3 - n/c
4 - Transmit Audio Input
5 - COS Output
6 - PTT Input
7 - n/c
8 - PL Decoder Output (Sense)
9 - PL Select Input

The COS output and PTT input are open-collector to ground signals. Pin 8 goes to +9.6 V when PL is decoded. Pin 9 is ground for PL, open for Carrier.

These modifications allow "PL and Squelch" operation. This means that when in PL, the normal squelch circuit still operates. This avoids long noise bursts upon unkeying.

If using an Advanced Computer Controls controller, the signal at pin 8 is run to the "PL Sense input" on the controller. It will drive this input directly.

Order the crystal on the repeater RECEIVE frequency. You must specify HIGH SIDE INJECTION. If you do not order a high side crystal, the transmit offset will be 5 MHz above the receive frequency, instead of 5 MHz below. I recommend sending the channel element to the crystal manufacturer for temperature compensation. Use a KXN-1024 element for 5ppm accuracy, or use a KXN-1029 element for 2ppm accuracy. Disable the receiver AFC by jumping the appropriate pin of the channel element to ground.

List of Tables and Illustrations

Step-By-Step Instructions for Modification

Step 1: Make sure that the radio operates properly BEFORE any modifications are done. If there are problems with the radio, they will be easier to fix before the mods are done.

Step 2: If you are satisfied with the operation of the radio, construct the control head plug per figure 1 and table 1. Use miniature pots and switches inside the control head plug. It is rather tight inside, so be careful to check that the connector will re-assemble before you drill it up. After you have constructed the connector, make the following connections inside the radio: Jump control head pins 3, 8, and 22 to "A+" on the control board. Jump pins 9, 11, and 17 to ground on the control board. Next locate the two feedthrough caps which power the Transmitter Power Amplifier. They are just to the left of the control head plug on the bottom side of the radio. One will have a red wire, and the other a black wire. Jump from the feedthrough with the red wire to the "A+" trace on the control board. Jump from the feedthrough with the black wire to the ground trace on the control board. There is a reverse polarity protection diode on the control board which can be used to make these connections. Next, plug your control head plug into the radio and verify proper operation with the new control arrangement. If there are problems here, troubleshoot them NOW. Do not wait until later, as you may be chasing more than one problem.

Step 3: You must make some modifications to the control board and the receiver audio/squelch board in order to make the radio full duplex and to make preparations for the interface board. First, remove JU-905 on the control

board. Then, jump the F1 channel element to ground as described in the Motorola manual. Next, jump pins 1 and 4 of the audio squelch board. On the later version audio squelch board, there is a place for a jumper (JU-202), on earlier units, just make the jump with wire wrap wire. Next, remove a jumper on the audio squelch board which goes from pin 3 of the PL decoder to IC-202 pin 8. This is near the pins which the PL board plugs into. Next, ring from pin 3 of the PL decoder to pin 11 of the audio squelch board with an ohmmeter. There should be continuity here. If not, add a jumper. The later boards have a trace from pin 3 of PL to pin 11 of audio squelch, on earlier boards, pin 11 is unused, and you should jump from PL decoder 3 to audio squelch 11 with some wire wrap wire. Add 15pF capacitors between the following pins on the two chips on the audio squelch board. Figure 2 details the location of these caps. On IC-201, add a cap between pin 3 and 4, and between pin 3 and 5. On IC-202, add caps between 5 and 9, 5 and 13, and two caps between 5 and 15. This makes the board less susceptible to RF.

Step 4: Next, carefully remove the front casting from the chassis. This is done by removing the four screws top and bottom as well as two screws on the control head plug. This is kind of tricky, so be careful to remember how you got it apart so you can re-assemble it later. Next, examine the Power Amplifier section of the radio and notice the miniature connector which connects the output of the PA to the circulator. Unplug this connector from the circulator using a needle nose plier or hemostat. Next, turn over the radio and remove the power control board. This will expose the top plate of the circulator. Remove the circulator by carefully removing the sensing wires which connect to the power control board and the two screws which hold the circulator in. You will have to unplug the receive antenna coax from the preselector unit in order to remove the circulator. Set the circulator aside for later modification.

Step 5: Procure a BNC chassis mount connector for a receive antenna jack. Mount this connector on the top side of the front casting on the side opposite from where the lock is located. Be very careful to locate this connector so that it does not hinder the operation of the latch mechanism. Attach a small coax to this connector and route it to the receive antenna jack on the preselector unit. Drill a hole in the front of the radio chassis to pass the coax. This will be obvious once you have examined the unit with the front casting removed.

Step 6: This is the toughest part of the conversion, the circulator modification. Figures 3, 4, and 5 detail the conversions. Remove the cover from the circulator unit. You will notice that there is a circulator, an output filter, the antenna switch, and the circulator reject load. There are three trimmer caps, only one of which has an access hole in the top plate. Measure and drill the top cover so that you have access to all three trimmers from the outside. This is necessary because the cover affects the tuning of the circulator. After drilling the cover, set it aside. You must now remove the antenna relay. This is a small relay on the right side of the circulator. The small dark red rectangular unit with a wire coming from the relay is the reject load for the circulator. The relay switches the output port of the circulator between the receiver and the reject load. You must remove the

relay and wire the dummy load back to the output port of the circulator which is on the common side of the relay. Refer to the diagram for the circuit. The easiest way to accomplish this is with a small piece of teflon coax (RG-188). Run from the circulator port to the reject load. You can solder to the circulator case for the shield on the load end of the coax. Replace the cover on the circulator and reinstall it in the radio.

Step 7: Construct the interface board using the schematic and board layout in the packet. Install this board on the three unused mounting tabs near the rear center of the radio. These tabs are above the control board. Wire the board up as described in table 1. At this point, the radio will be operating full duplex, and you should be able to put the radio in PL by flipping the switch on the control head plug to the PL position. Verify that you have +9.6 volts at the 9 pin molex connector PL SENSE pin when the correct PL code is being sent. Also verify correct receive audio gating and COS action.

Tune Up Instructions

Tune the radio per the Motorola manual. Once you have achieved this, you need to tune the circulator. The following procedure should be followed:

Step 1: Remove the power control board, and power the radio with a supply having a current meter.

Step 2: Attach a jumper or clip lead from feedthrough C527 on the Controlled Stage in the PA compartment and feedthrough C536 on the driver stage in the PA compartment. This will force the radio to maximum power output.

Step 3: Key the transmitter and tune the three circulator capacitors for maximum power output.

Step 4: Reinstall the power control board, and preset the drive limit pot fully counter-clockwise. Set the power set pot to the desired power output level. I recommend no more than 50W out for a 75W radio, and no more than 60W out for a 100W radio. The 25 and 45W radios are rated continuous duty at 25W output.

Step 5: Key the transmitter and tune the center circulator capacitor (the only one accessible from the top of the power control board) for minimum current draw. You should be able to make several Amps difference without affecting the power output.

Step 6: Turn the drive limit pot 1/4 turn clockwise.

That's it. you are now ready for major repeating action. Remember to always set the receive frequency first when setting frequency, as this affects the transmitter also. Set the transmitter with the offset trimmer coil on the exciter board. Make sure that you have adequate forced air cooling on the PA at all times during operation. The Micor PA is not easy to fix, and when it blows, it blows big.

>n4wfk@louisa.net

John,

I just purchased a IC-706MKII from HRO in Atlanta, GA. I got quotes from about 10 different distributors and the lowest price I found was $1249. HRO will match the lowest price and ship it FREE. I ordered mine Friday morning and it was delivered in to me in Knoxville, TN the following Monday.

Hi, thanks for reading!
I'm considering the purchase of a Kenwood TS-570D. I read the CQ article and it seems like a good radio but I'd like to hear from someone that owns one and is not trying to sell magazines and advertising. I have a TS-440S and it's been a good radio but all the new goodies are attractive. With the $200 off coupon Kenwood is offering, the 570D appears to be a bargin. Let me know what you think.

Thanks,
Gary

>David - AB2CI

David, if the scratches are light surface scratches, get some optician's
rouge and just polish them out. But if the scratches are deep, check with
your local auto glass place. They have a kit which *fills in* the scratch
with a thermosetting material which has the same optical property as
glass. The scratch just "disappears". This stuff is pretty remarkable.

2879. Re: How well does DSP work?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-13 00:00:00 UTC
From: Phil Wheeler <w7ox@ix.netcom.com>
Message-ID: <346B18E7.2C5E63EE@ix.netcom.com>
Source record: 161985

I own a TS-570D and a JPS NIR-12.

First thing to say is that NR1 on 570D is good on SSB; NR2 is great on CW. NR2 on SSB results in unpleasant audio.

Second thing: JPS NIR-12 is better than the internal 570D DSP on SSB, no question; too many burbly artifacts with NR1 on 570D -- and they are not there on the JPS NIR-12. On CW I prefer NR2 on the 570D -- with a 500 Hz xtal filter.

Third: I'm told that the top-of-the line Timewave is better than the NIR-12 for *most* things; a couple of knowledgable friends did some A/B tests of the two units.

Phil

2880. Re: TS-570D Opinions

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-13 00:00:00 UTC
From: Phil Wheeler <w7ox@ix.netcom.com>
Message-ID: <346B1AAC.AF016A22@ix.netcom.com>
Source record: 161986

QST did an extensive review of the 570D in the Jan 1997 issue.

I own one and like it; MAJOR improvement over the TS-440SAT I owned (and that was a very nice radio). The DSP is not as good as that on some other rigs nor is it as good as my external JPS NIR-12 (so I still use it); but then the NIR-12 costs $300+ and should be better.

If you have any interest in 6 meters (and do not have a 6 meter rig) consider the 570S with adds 6 meter capability.

More recet 1997 issues of QST have reviewed the competing Yaesu and ICOM rigs in the same general price range.

I have recently installed an ICOM 2710H in my car. It comes
standard with a rather nice microphone, but there are not
instructions or attachments included to mount or hang the
microphone in the car. How do you other ICOM owners deal
with this? Suggestions will be appreciated, TIA!

2884. Re: Alinco DJ-S11 in the real world??????

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-13 00:00:00 UTC
From: jspen@aol.com
Message-ID: <19971113172601.MAA15444@ladder01.news.aol.com>
Source record: 161990

It works quite well if you remember it has limits. Simplex with another ht is about one mile in an area with houses. With a base and elevated antenna, range should be good for at least two or more miles. It is presently selling for $88 from some sources and is a great grab and go radio if you have a good repeater system with links. Battery life is no problem with the alkalines. With the internal mod, receive frequency range is increased greatly.

2889. Marine Mobile Amplifier Suggestions

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-13 00:00:00 UTC
From: Roger Palmer <rpalmer@islandnet.com>
Message-ID: <01bcf05e$f568a800$54ac35c6@Roger.islandnet.com>
Source record: 161995

I am considering adding a solid state amplifier (about 500 Watts) to my HF rig on my boat, and am having difficulty coming up with the "right" choice. I would prefer to buy a piece of commercial equipment.

I currently have an IC-735 running on 12 VDC into an AH-2 automatic antenna tuner. The tuner is grounded directly to my deck (this is a steel boat) and feeds an inverted L between the two masts. Total antenna length is about 35 feet. It gets out quite well compared to other marine HF installations (presumably because of the excellent grounding environment), but I need more power in order to check into the 75 metre marine nets when I am cruising up in Alaskan waters.

I have two constraints: power and size. The power issue is primarily one of voltage - the boat's batteries are 24 V (LOTS of capacity), and a high power inverter also provides 120 VAC. My IC-735 runs off a power supply plugged in to 120 VAC. Ideally, I would like an amplifier that can run off 24 V, but most units seem to run either on 12 VDC or 48 VDC - both therefore requiring some type of power supply.
The available space for the amplifier is 6.5 inches high ny 12 inches deep by 12 inches wide - this would seem to eliminate any existing tube amplifiers.

I have looked at the Ameritron AL-600, and it is a good candidate, but comes in two units - one is the amplifier (which will fit nicely), and one is the power supply (which I would have to find a space for).
I have also looked at the SGC-500, but it requires 90 amps at 12 VDC, so I will again have to get (or make) a power supply that either runs off of 24 VDC or 120 VAC. I am not aware of any other amplifiers that will fit.

The next problem is the antenna tuner. The AH-2 will only handle 150 Watts, so it needs to be upgraded. The only suitable device that I have found is the SG-235 by SGC - this handles 500 Watts, but is a fair bit of money.

It would be ideal if the power amplifier were integrated into the remotely-mounted antenna tuner! TI made a marine SSB like this in the early 80's, but of course it was only 150 Watts, and is no longer in production.

So - there is the situation. I would appreciate any other suggestions for ways to get 500 Watts into a random length antenna while minimizing size, the number of units, and maximizing power efficiency!

Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

Thanks for reading!
I have a Kenwood TS-440SAT for sale. I am the original owner and it will be shipped in the original boxes with the manual. The radio is in excellent condition. It has the automatic antenna tuner, 1.8KHz SSB filter and the 270Hz CW filter. It also has the IF-232 Level Translator and IC-10 Computer Interface for computer control.

TS-440's in general, have had two problems. The main CPU was originally socketed, mine was soldered to the board by Kenwood. Secondly, the VCO's were potted with a glue like stuff that became conductive with age. Mine was completely cleaned of the glue and re-aligned by Groton Electronics last year.

The price for the radio is $750 including shipping. If you would like to talk to me about the radio I can be reached at 716 544-0773 after 4:00 est or by return E-mail.

Thanks!

Gary Winkelman

From: DavidC <davidc@bit-net.com>
Message-ID: <01bcf079$3ebb42a0$098a92d0@bitnet.bit-net.com>
Source record: 162003
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I have examined the gel-cell battery that so many were so kind in answering my charging questions about, here are the details - I wonder what they say most specifically about getting it up to full charge from the current 11v state, and what sort of regulation of the ongoing float charge is advisable? (It will be powering a TS-440SAT, and perhaps a couple of small periperals, e.g. NIR-10 filter, etc. through a MFJ 12V power strip.)

Johnson Controls Model: Dynasty UPS 100 12 Volts
Charging Voltage: 13.5 - 13.8 vdc @ 77 degrees F
Equalize Charge Voltage: 14.4 - 14.8 vdc @ 77 degrees F

What is the difference between the two and how does that impact proper charging protocol, please?
--
Thanks, again, in advance & 73, DavidC AA1FA

Dan I have aproximately 20 years of experience in the comunication field
and what your problem sounds like is your duplexers are terribly misaligned
have they been tune with a good quality spectrum analizer ;
and if so i think it needs to be recalibrated because if you have noise on
the receiver when the transmitter is fired up you must not be notching out
the transmitter

: first the duplexer have to be tune to center frequency between tx & rx the
you adjust the rx pass side of the duplexors to maximum signal from a low
power rf generator then tune set the tx to 10 watts out put then tune the tx
pass to maximum output should be arond 8 to 9 watts out through the
duplexors then after that is done take a rfvolt meter that is farly
sensitive and put it on the receive side of the duplexors and tune the rx
knotch filters to minimum meter deflection forward while the transmitter is
fired up the do the same to the tx knotch filters of the duplexors while
injecting about the same power ouput on the rx side of the duplexorsand tune
to minimum meter deflection. after doing alll this the end result is that
the center between the rx &tx is balance equaly therfore the tx&rx have bith
maximum separation between them .
Remember with a spectrum analizer it allows you to tune duplexor at really
low power and that is why you have the problem the is a power curve in the
duplexors that with the spetrum analyzer you are not taking it into account.
as you increase outputon the tx the separation deteriorates dramatically .

I need a few of the plugs for the bottom of a Standard C510A
handheld transceiver. They look like cellphone charging/antenna cables.

Standard advertises an adapter for $100, but
I can't find anyone who actually sells 'em. I don't need the whole
thing.
Too spendy for the quantity I need anyway.

So, it someone
could look up the part number of the plug, maybe it comes with attached
cable, I'll try to order some.
Thanks, miker

Hi Tom....out of the 3 radios you listed...
Go with the Yeasu...It has a great display, and it appears to have the best front-end of the three. A good front end (rare these days) is absolutely essential if the radio is going to be used in major metropolitan areas. Good Luck with your choice.....73 de Todd.

> dipole ? What impeadance and type (balanced / unbalanced) of feedline is
> used ?

I'm currently working to get an SGC-230 running in an inverted vee
configuration from the top of a tower. I'm having some problems, but I
don't think they're related to the configuration.

The key point is that the ground lug on the tuner is isolated from
chassis ground, so you can hang half the wire off of it. In my setup,
the tuner is at the top of the tower with the hot lug feeding one side,
and the ground lug feeding the other, of the vee. According to SGC, a
length of 57 feet is good for each side of the wire, as that presents a
relatively high impedance (which the tuner likes) in all the ham bands.

I'm having a terrible problem with RF feedback on 40 meters --
transmitting with more than about 30 watts output from my Drake TR-7
causes all sorts of things to start glowing in the shack, but from the
testing I've done I'm pretty sure that it's due to something other than
the antenna configuration.

Yours is around 600 ohms with enough poop to drive about anything.
Lots of background noise. Was originally meant for the CB crowd.

>2. What is the small slide switch mounted inside the base with positions
>marked "E" and "R"? How do I set it? I intend to connect this
>microphone to my Yaesu FT-840 HF Transceiver (requires 500-600Z

"E" is for electronic switching
"R" is for relay switching

One or the other should work but you still might have to rewire it.

>Also is there any mods for this receiver?
>thanks
>de Larry
>

If you are intending to interface to a computer you need the CT-17 and UX-14. The UX-14 installs inside of the R-71A and converts an internal connection to the CI-V system. The CT-17 is a RS-232 to TTL level converter.

The CT-16 is a satellite interface that allows two ICOMs to track each other. It will not help with computer interfacing.

2918. Re: How well does DSP work?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-13 00:00:00 UTC
From: nitz@clark.net
Message-ID: <64dvep$p4l@clarknet.clark.net>
Source record: 162067

Bill:

I have a Kenwood 870 and I'd say the following about the DSP characteristics:

1. The person using the radio must know how to use the DSP features. The 870 has menu driven parameters that adjust the filtering algorithm, and the speed (i.e reaction time) of DSP processing, etc.

I don't know if the 570 is similar to the 870, but the IF notch filter is just awesome at filtering out an offending carrier.

The SPAC (Speech Processing Auto-correlation) filter creates interesting sound affects and is relatively useless on SSB but works true magic on CW, Provided the signal is pretty strong. It makes the CW signal appear to 'pop' out of the noise.

The Line Enhancer (enhancement?) mode (LEM) on SSB sometimes smoothes the signal from the noise, but I haven't noticed a night/day difference with this SSB filter. The 870, however has 'brick wall' digital bandpass filters which effectively perform the same functions as the high-cut and low-cut on your 850....except that much more of the signal seems to be preserved while the interference is being cut. Plus there's nothing like having a 7000hz bandwith to listen to A.M. signals. SSB signals even sound broadcast quality when the frequencies aren't busy. The 50hz bandpass setting on CW allows you to seperate all but two signals that are on the exact same frequency.

The other benefit to the DSP's are the transmit audio equalization. If you work lots of SSB and want to have the A.M. quality sound, these latest crops of radios are hard to beat. Plus with the push of a button, you can switch to your 'war mode' sharp processed audio to break through pile-ups.

I traded my 850 in two years ago for an 870 and noticed a HUGE improvement in the radio. Loved that 850, but the 870 is a totally different class of radio. My guess is that the 570 has got a lot in common with the 870....sure 570 owners could comment more specifically.

Good luck with your decision.

>>I'm looking for recommendations for a hand-held 2-meter radio.

One of the hottest product lines currently is from the folks
at ADI. Their AT-201HP has 40 channels memory, and accepts
universally-available accessories (batteries, earpieces, headphones,
et al). The ADI-201HP is available for less than 200 bucks!

Although I purchased my HTs before ADI came on the scene, I can
appreciate their value for your money.

Source record: 161885

You need to consider each device or product in any manufacturers line independently, virtually all have produced some great and poor quality products for one reason or another.
MFJ started off producing somewhat rough but cheap devices and has now grown to the point where they have a full range from excellent to shabby in quality or performance ... but then some of that is in the eye of the beholder.
Example: The MFJ-1796 vertical for 40-2 meters is designed as a compromise antenna for hams who have just a tiny amount of space. It cannot compete with a simple half wave dipole, let alone anything else.
MFJ isn't very forthright about that in their advertising on their web site,
thus some may buy that antenna and be very disappointed and call MFJ stuff junk - MFJ's fault for over-hyping a marginal product - customer's fault for not thinking about what it means to have a 12 foot vertical on 40 meters! The antenna is sort of similar to a simple mobile vertical, better than nothing (though hardly a gain antenna), but used because it is the only way for some to operate at all!

The MFJ-259 antenna analyzer on the other hand is a wonderful piece of gear, highly versatile and does all the marketing hype fols at MFJ claim it will do.

I have owned several different pieces of MFJ, and other manufacturers, products - "my mileage has varied"! :-)

My advice is to select what specific product you are interested in from any manufacturer, then post a request for experienced opinion on the appropriate newsgroup.

Hope this helps. 73, DavidC AA1FA

Since when has an MCX-100 been worth $150? Sellers can hardly give
them away at the local ham swaps. Difficult to impossible to have
programmed (how many hams have ready access to an R-1800 programmer?),
uses a 1-time PROM (82S129, 131, etc.), limited number of channels, etc.

If you would list such an item for that price, it casts suspicion in my
mind on all of the rest of your prices.

Greetings! My fanfairs to MFJ's product have been more good than bad. For the past 16 years or so the QC hasn't been very good. However, a little touch up here and there would make myself a happy camper of their products. Sort of like you know you are buying a piece (semi)defective equipment and you are ready to see what's inside when you cut the box open. Once the glitch is fixed, the equipment works just like what you pay for, and reliably. Certainly, once in a while you'll find your new purchase works flawlessly without any follow up.

I can't afford buying big time HP or Bird equipment, but for a normal to small Ham like me, the performance of the MFJ's equipment is more than satisfactory. Nothing fancy but they are solid performers (when it passes *MY* QC department).

Many people call the MFJ equipment the "Mighty Fine Junks"; however, just about these *MFJ* have filled the otherwise expensive shack in my basement. Sort of like icing on the cake, you know.

Best 73!

2935. How good or bad is RF noise in Dodge Caravans?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-14 00:00:00 UTC
From: "F. Feeney" <*spamsaver*_fkf1@cornell.edu>

Source record: 161888

Looks like I'll be moving the HF mobile setup from my old 1985 caravan to a newer 1994 model this weekend. I'm wondering what to expect in terms of RF noise. The old one had a carb and I think no fuel pump in the tank. The new one is injected I guess, and that means pulses to the injectors as well as one of those fuel pumps.

I'm wondering how good or bad HF mobile in this vehicle is likely to be as far as noise. It seems I do most of my hamming in the car these days, so I'm hoping that other than the clock crystal in the radio messing with certain 2 meter frequencies, I'll be ok. Anyone have any data points? Do I need to be concerned about RF emi to the engine controller or anything?

The rig is a dx70 plus a dual band FM rig, and the antenna is a screwdriver on hf and magmount larson on vhf/uhf.

Thanks in advance.

I have had many pieces of MFJ equipment through the years, and still do.
I have found that I have to repair just about anything I buy from them.
I have come to expect to do it.

But, when I get it repaired, it does work well for years to come. And, I
find it is usually worth the money. Not great stuff, but it will get the
job done after you get it working.

Hi Jack, sure you can, just turn the power way down and connect it to a
dummy load, or even a 60 w light bulb!

Don't know if your Icom has the same feature but if I turn the vox off on
my FT900 it won't transmit but I can still hear the cw sidetone.

Hi over there

Does anybody know something about Yaesu ft411e transceiver?
I have this model and it has three buttons on the left side: Lamp,
Tone, and PTT. The problem I have is that the Tone button does'n make the
trx
transmitting repeater opening tone (about 1700hz) but it acts as short
openning for squelsh. Is there away to make the button act the Tone role ?

many thanks

>
>Thank you in advance for your experience and comments.
Hi Jim,
I can give you my comments re the 706 Mk1.
I use it exclusively mobile for HF, 6 and 2m. HF and six are fine, the
radio compares favourably with my TS430s and with the transverter on 6.
The noise blanker is very effective but does affect rx'd audio on strong
signals (they become distorted). This is generally not a problem as if
the signal is that strong then it is audible with the blanker switched
out.
2m is a different ballgame as I find the rx pretty deaf. An external
pre-amp (as opposed to the built in version) some improvement but it is
not as good as my earlier dedicated ICOM mobile FM rig. On two metres
the rig also suffers from paging interference when within a mile or so
of a paging tx. The Mk2 should be worse in this respect as the out of
band performance has been enhanced.
Out of band performance (general coverage)is very poor, but then is this
what you want?

>People I know that have Alinco's, wish they didn't. Kenwood and Yaesu are >good. Look into your operating environment and needs, and find out which >one is better suited.

All of my Alincos work just dandy, and all but one of my friends who have them like them too. That one poor soul has had his back to the factory twice with an intermittant problem (its in warranty). OTOH, everyone I know with a Kenwood VHF+ rig has had problems of one sort or another. I've had simply horrible problems with them myself. They tend to overheat and eat their PA modules, they wander, and they are prone to all sorts of strange intermittants and firmware quirks. Their user interfaces generally really suck. They also receive pager crud very well. These mostly seem to be design problems rather than quality control problems.

Some of the Yaesus make fine paging receivers too, but some of them are Ok. Icom ditto, some good, some not so good. Standard mobile radios, the few I've seen, appear to be on the good end of the spectrum, but also on the $$$ end of the spectrum. I haven't seen enough of them to form any firm opinion, however.

None of the manufacturers are perfect, and lemons slip out into the market from all of them, but in my experience, Kenwood should change their name to Sunkist. I don't know what the deal is with them. Their HF stuff is generally good, but it is as if their VHF+ stuff comes from another company, perhaps their gameboy division.

Kenwood may be getting their VHF+ act together, I've heard good things about their newest dual bander. And factory service seems to have improved from the very dreadful level it has been for quite a while. Icom used to have the best factory service, but that seems to have slipped a bit. Their shop manuals are still the best, though. Yaesu does Ok in this department (and they're willing to provide over the phone help to the home repairman), and Alinco seems willing if not totally capable. I've had no word on Standard service (never needed it, and don't know anyone who has). But their operator manuals are the absolute pits.

Note, I prefer to do my own service work, but if the thing is in warranty, it makes sense to take advantage of that, so knowing the quality of factory service to expect is somewhat important. Note also that factory *authorized* service is a different can of worms from factory service. The quality of work by the independent authorized repair shops varies by shop, regardless of manufacturer.

It's hard to judge equipment based on a few example units. Some people never have a problem, others are plagued by lemons. Luck of the draw

I guess. I obviously think Alinco delivers good value for the money and don't have a very high opinion of Kenwood. Others may differ. I have owned radios from all of them, and currently have Alinco, Icom, Yaesu, and Standard radios. Each has strong points and weak points. All of them are better than any Kenwood I ever owned, especially the dreadful TS790A.

I'd hate to have to choose just one of them to keep, but if it came down to that, I think it would be my Alinco 570T. Its a very user friendly radio with a nice big heatsink. But OTOH, I'd sure hate to part with my IC275H and IC475H. And even though you need to keep the operator's manual with you at all times, I'm somewhat fond of my FT8500 too. I can't get worked up over my Standard. It works well, but it seems kind of bland. On the HF side, my IC735 is the Energizer Bunny, it just keeps working and working and working. My IC706 is good too (now that I've modified it to cure most of its design failings). It takes a beating in the 4x4 with nary a wimper even though I've operated it without an antenna on several occasions (low limbs are wicked).

In the end I'd suggest that you buy what strikes your fancy. If you find out you don't like it, buy something else. No use leaving any money around for your heirs to squander.

This voltage is the float voltage, i.e., you leave it hooked across the
power supply or charger at all times, and only use the battery for
either the equivalent of a large capacitor when you key up, otherwise
the power supply handles the needs of your station, and as an
emergency power supply when power fails. Most batteries do quite
well, and have a nice long life.

>Equalize Charge Voltage: 14.4 - 14.8 vdc @ 77 degrees F

This means that you charge the battery up to this voltage, then cease
charging. It requires either that you have an automatic cutoff circuit
or monitor the voltage as it charges and cut it off manually. Do not
let the voltage across the terminals exceed the Equalize Charge
Voltage, or you cook the battery eventually. It also implies that
then the battery is then used as the sole power supply for extended
periods of time until the battery voltage drops down to 11.6 volts or
so. This requires either attention to the battery voltage by the
operator, or a cutoff circuit. Dropping the voltage too low absolutely
lowers battery life.

>What is the difference between the two and how does that impact proper
>charging protocol, please?
The 13.5 -13.8 charging technique allows you to leave the battery charging
at all times, it will however give slightly less in amp hours available
right after charging stops in an emergency. I am not familiar with
your Johnson Battery nomenclature. I would guess that you have a
100 amp hour battery given the name. First, FUSE that thing with a
30 AMP or so Fast Blow Fuse. Spare fuses are cheap, and your battery
will withstand 30 amps for a short period of time, and a fuse holder
connected directly to the positive terminal assures no shorting accidents
that don't blow the fuse. Then if you have a relatively large power
supply with 10 amps or so of power, you can power your station
and still have emergency power. It must be regulated, as the voltage

absolutely shouldn't go above 13.8 volts for long term usage. You can also try a larger solar array, but that definitely requires regulation and diodes to protect the battery, or an eagle eye on what is going on with voltage.

I would not ordinarily reccomend the other charging technique of equalizing voltage absent some method of automatically measuring the voltage and cutting the charging on if the voltage drops to 11.6, and cutting it off at 14.4 volts. There have been articles detailing how to make such circuits if you're a builder or you're a typical frugal ham or alternatively, there are commercial circuits available which do work, but cost a lot. Almost any company dealing in solar arrays sells them. I might also add that if your battery is 100 amps, that's only about 3 hours of transmitting before you have to get off the air, if you cycle the battery, rather than float charging it at 13.8 volts or so, so that is another definite consideration for you.

2949. VX-1R & the ADMS 1D Software copy protection

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-14 00:00:00 UTC
From: Ingra-Beton@t-online.de
Message-ID: <64h23p$707$1@news01.btx.dtag.de>
Source record: 161902

You may have noticed that the new ADMS 1D Software is copy protected.

At the installation it is checked if the original disk is inserted,
and only if it is, the Installation process will continue and in your
C:\WINDOWS\ directory a file Named INFO.DLL will be created. This
file contens data according to your PC (CPU, RAM, HD, ..) and if you
copy the files to an other PC the Software will not work.

That means that after every change to your System you will have to
reinstall the Software.

Let's suppose you are in vacation, somewere far away, with you Laptop,
a RAM Module burns, you buy an other (smaler), your System have changed!
Well, you will have to carry the ADMS 1D disk everywere.

There are 100 of situations you would be glad not to have that
copy protection.

Not to menshion the possible loss of your original disk, the Backup
on tape or a similar device would be useless.

So, there is a simple way to bypass the checking of the INFO.DLL file
for the VX-1 Programmer by changing only 3 bytes in the VX1.EXE

You need just the VX1.EXE and the VX1.HLP, you can copy them were
ever you want and they will work without the INFO.DLL or the
original disk.

Who needs this information FOR HIS OWN BACKUP, Email me.

Greetings, ...

One way to determine if the problem is external or internal to the
repeater is to place a 50 ohm dummy load (Bird if you have it) at the
antenna connector of the duplexor cavities...Tune a signal generator to
the Receiver freq. with a short length of wire for an antenna on it, and
increase the signal generator until enough signal leaks thru to open the
receiver with fairly good quieting...Then key the transmitter and see if
the noise is there...If not then it is being caused by some external
source...If the noise is still there, then you have got work to
do...Here is what I have suggested to repeater builders in this area ...
1. All coax inter-connecting cables must be double shielded or hard-line
including receiver-duplexer and transmitter-duplexer and
duplexer-antenna runs...Single shielded coax simply will not provide
enough shielding.
2. The Receiver and Transmitter should be enclosed completely in a metal
box if the cases themselves do not contain RF shield bonding braid
on the case covers.
3. Mount the receiver and transmitter as far apart as possible in a
rack. In the ones that I have build, I put the Receiver and
controller at the bottom of the rack, the duplexer in the middle, and
Transmitter at the top of the rack...That allows the coax runs
from the duplexer to go in opposite directions to each unit and
minimizes
any coupling between those cables.
4. Hard-line from the antenna should connect directly to the antenna
terminal of the Duplexer...If you have to use a jumper cable make
sure it is also hard-line (1/2 inch)...
5. Receiver input circuits should be of Helical design and any pre-amp
should also have Helical tuned circuits and I recommend J-FET amps
be used...
6. Transmitters should be designed for repeater use...That means
continuous duty operation and extra tuning circuits to limit the
bandwidth of the noise they generate...Crystal controlled
transmitters generally have less noise output than synthesized units.

Commercial 2-way mobile transmitters that are designed to work over
a wide band usually have high noise output along with the desired
signal...This makes them undesirable for repeater use as they
generate noise at the receiver input frequency...

Good luck on your Witch hunt...

Source record: 161929

Hallicrafters S-40a 1947 model, dark green finish, green dial indicators, new filter capacitors. Paper capacitors replaced with ceramics, new power transformer, new tubes. Good finish. Restored and tuned to work well. Includes the original manual set (a little yellowed after fifty years).

This is a nine tube rig with RF amplifier and BFO. Does well with AM, CW and SSB. It was the middle line model in 1947. The S-38 was the cheapie and the S-42 was top of the line, rare and expensive.

$85.00 + ship C.O.D.

Hello and thanks for reading this message!

I have the opportunity to buy a YAESU FT-102 fully loaded, including:

-AM/FM board
-All filters:
+AM filter
+Two CW filters
+SSB narrow filter
-User's Manual
-Technical Manual

Could you enlighten me about a good price for this rig?. If the AM filter
really scarce?.

Thanks!.

I've owned and used MFJ products for over 20 years. I've used their CW keyers, audio filters, antenna tuners, QRP rigs, VSWR analyzers, Wattmeters, dummy loads, etc. I have several of their products in my station right now. For the money, their stuff is hard to beat. Over the years, MFJ has had a lot of quality control problems, such as bad soldering, loose or missing hardware, poor wiring techniques. Once you fix these things, the products will work fine and last a lifetime. I had the chance to talk with Martin F. Jue (owner and founder of MFJ) at a hamfest a couple of years ago. He's a very nice man, and he really listened to what I had to say. They are working hard to cure the QC problems and turn out a better product. That's been their main complaint for a long time. I think they are succeeding in their efforts. Recent stuff I've bought has been in good shape when I got it.

I'm sure you will receive dozens of responses to your post, and I would bet most of them will "slam dunk" MFJ, saying their stuff is really crap, not worht the money, etc. I happen to think this is not the case, but hey, who am I? Just some ham who's been using MFJ products, successfully, for over 20 years. I'm sure the new guys' opinions are much more valuable than those of some ol' fart.

: in this group saying what you have (had) and what you thought of it.

I have had some MFJ items that suffered from poor quality control --
bad soldering, holes in PC boards not properly aligned with circuit
traces, etc. But I think their basic designs are good, often clever,
the prices are low, and operation has been satisfactory after
repair. My recommendation: be ready to open it up and touch up the
soldering. It's the same treatment I would give a used Heathkit
assembled by someone of unknown abilities.

I should also mention I haven't bought anything from them for a couple
of years, quality control is something they could easily improve and
they may already have done so.

Bob,
I have mixed feelings about MFJ. They often make products that
are exactly what I want, and generally for a price I can pay (I'm
on a rather limited budget; no multi-$1000 radios for me). The big
drawback with their stuff seems to be its physical durability and
overall quality of construction. Cases are not as solid as they
should be, switches get punky over time, odd design flaws are found.
I have, have had or have used, quite a few of their products:

MFJ-1270B TNC (OK, but creates huge RF interference in my HT
if I use a duckie or local telescopic ant instead of a
more distally-located antenna)
MFJ-284 speaker-mike (OK, but the cord broke after 1/2 year,
and the earphone jack does *not* disconnect the speaker,
to my endless amazement and frustration!)
MFJ-1714 2M halfwave antenna (seems fine, but it's seen
limited use so far)
MFJ-249 antenna analyzer (how did hams live before these
were invented? the one I've borrowed has bad trouble with
a punky switch, however)
MFJ-941D antenna tuner (works OK. Caps noisy when tuned, and
pushbutton switches seem similar to ones I've had on
other "inexpensive" [cheap] equipment that have failed).
MFJ-??? straight key (cheap in price, cheap in quality. I knew
what I was getting when I paid ~$8 for it, and I wasn't
at all surprised when I got an $8 key. It works, tho).

I guess that last item about sums up MFJ. Don't expect wonders
for your pennies, and you'll not be disappointed. They fill an
important niche for hams like me.

Bob, KI8AB

I have purchased 2 pieces of MFJ gear in the last couple of years - one was their 2/440 thru-glass mobile antenna (it disintegrated during installation, and what I saw inside the matching unit made me puke) and the MFJ432 digital voice keyer, which is practically unusuable for any real-world contesting application (horrible design). On the other hand I have a rather ancient MFJ memory morse keyer which works passably.

I would generally not buy their gear, but then it wasn't ever really intended for professional usage, and it's relatively inexpensive, so I guess you get what you pay for.

2986. FT-50 uploading problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-14 00:00:00 UTC
From: law@nh.ultranet.net
Message-ID: <879547415.77435@ninsun.nh.ultra.net>
Source record: 161962
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur

I have an ft-50 and am experiencing uploading problems. I can
upload a template file, and a data file, but when I try to download a data
file to the radio(with or without a template file), it either won't start
or starts only to get to either 6, 8, or sometimes 52%, but then times
out. Now I believe I have managed to get the radio into European mode,
because I can't enter 146.805 (a local repeater), just 146.80. I have tried
to chnage the step manually to 5.0 but this still doesn't seem to help.
I'm not sure how to get it back now, it appears I'm stuck.
If someone could send me an initial template and/or data file they saved from
there radio (US version please) it would be greatly appreciated. Atleast it
would be something else to try.

p.s. Yes, I did save a template and data file doing anything else but still
can't seem to upload them back to radio, and I haven't made any
hardware mods to it since. I am using the special adapter that ft-50
users must use in addition to the standard cable. Have a Pentium 133
I am using the software with. Any responses would be appreciated.

Thanks
Larry

2989. New MAHA/Periphex/Radio Shack fast charger

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-14 00:00:00 UTC
From: davem@cs.ubc.ca
Message-ID: <64iojt$ooi@zeppo.cs.ubc.ca>
Source record: 161965

Recently, I've noticed a new "universal" fast charger show up pretty much simultaneously on the MAHA web page, Periphex ads in ham magazines, and Radio Shack stores.

The charger has a clever "universal pins" setup, with a pair of plastic blocks containing several pin contacts. You open the end of the charger, which allows the blocks to be moved up/down and front/back until they are positioned correctly to touch the charging contacts on a particular battery pack. In all cases, the batteries lie horizontally on the charger, not vertically like most ham radio fast chargers. Some contact pins point up vertically for battery packs that have the charging contacts on their flat face (FT-50, most camcorder batteries), or the blocks can be raised to present pins that project horizontally for packs with the charging contacts on the bottom (most HT battery packs). There is a polarity reversing switch, so it doesn't matter which pin is positive or negative. Once the pins are correctly aligned, the end of the charger is closed, and this holds the pin blocks in place. The result is a charger that you can customize to charge many varieties of battery pack, but which requires some work to change from one type to another.

There is also a standard Molex connector for charging RC racing battery packs. (Despite MAHA's claims, it is *not* the Molex connector that the ARRL recommends for 12 V use). Finally, there is a set of clip leads that plug into the Molex connector for anything else that can't be charged using the pins.

The charger can also discharge cells before charging; the discharge rate is 400 mA. Charge rate is 800 mA, with trickle charge of 40 mA after full charge. Charge termination is by minus-delta-V, with the addition of a temperature sensor for overcharge detection. The pack is held to the charger with a magnet, and the temperature sensor sticks to the pack with a little magnet.

Power for the charger comes either from a wall wart, or a 12 V cigarette lighter cord. When powered from 12 V, the maximum voltage battery you can charge is 9.6 V.

Anyway, the chargers sold by MAHA, Periphex, and Radio Shack look identical. There are, however, some differences in the voltages that they claim that can be charged:

Periphex MAHA Radio Shack
4.8 4.8
6 6 6
7.2 7.2 7.2

8.4 8.4 8.4
9.6 9.6 9.6
10.8
12 12 12

The Radio shack manual says that the charger indicates the voltage of the pack by the number of flashes of an LED, or beeps (I don't remember which). The MAHA manual doesn't say anything about how the voltage is selected.

The MAHA version apparently has a measuring scale stuck in the pin adjustment area, and the manual includes a chart of where to set the pins for common HT battery packs. The others presumably do not include this.

The MAHA and Periphex claim to charge all NiCd and NiMH batteries. The Radio Shack version's manual says that it will also charge lead-acid batteries. This seems unlikely since minus-delta-v charging should not be used with them.

Ok, finally my question: Are these really identical chargers, with the only difference being in the instruction manual? Or have the different vendors got the manufacturer to include different software, to include lead-acid charging cycles (in the Radio Shack case) and support for more distinct pack voltages (in the case of MAHA and Periphex).

Does anyone already have one of these? How well does it work?

Dave

2990. Dodge Caravan's - how bad for RFI/EMI?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-14 00:00:00 UTC
From: "F. Feeney" <*spamsaver*_fkf1@cornell.edu>
Message-ID: <64igg9$fn9@newsstand.cit.cornell.edu>
Source record: 161966

With any luck, I'll be moving my mobile HF and VHF gear from my old 85 dodge caravan to a 1994 model. The old one has a carb, and so I think no tank mounted fuel pump to make noise and no fuel injectors to make noise either.

I'm wondering how much difference I'm going to find in the new vehicle. It's got ABS too, and a warning in the manual about high power transmitters potentially bothering it. Are there any installation recommendations from Dodge on installing radios? I'm looking at 100 watts off a screwdriver on the back and 50 watts vhf on the roof with?a mag mount. Am I just asking for trouble?? Most of my HF work these days seems to be in the car, and I'd really miss 40 meters on those long trips...

Any info would be appreciated.

Kevin, WB2EMS

2991. VX- 1R mods and squelch

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-14 00:00:00 UTC
From: dan.grassetti@kla-tencor.com
Message-ID: <879557311.10614@dejanews.com>
Source record: 161967

Apparently the latest VX-1R's are not so easy to modify to expand xmit and receive...but there's more. My VX has had a problem with losing control of the squelch if I don't hold the orange button in fully for the full boot cycle. The fix is a series of 22 steps that one implements after booting the radio while depressing the monitor, volume and function keys. What I found during one of many re-configurations of squelch was that all of a sudden the radio would receive all the cellular band and would xmit from 118 mhz on up to 500+ mhz. The problem is that I zapped the squelch once again and have since lost the extended xmit/receive.

So, does anyone know any more about this? I am quite sure that this radio can be modified with nothing more than the proper keystrokes, but am at a loss as to what they were....help!

Dan

2992. New Yaesu ft-846???

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-14 00:00:00 UTC
From: nitz@selectsa.com
Message-ID: <64ikck$3ir@clarknet.clark.net>
Source record: 161968

A question for all Yaesu fans who know something about the ft-846 HF/VHF rig:

1. Does it have an internal antenna tuner option?

2. How much does it weigh?

3. What are the approximate dimensions?

4. Will it have a removable face plate for remote mounting?

4. Is there an expected release date (or at least price/general information availability date) for this radio???

Thanks for any information you can provide.

73,

Jim Nitzberg WX3B

No info on the tuner part. Supposed to be available in January 1998. I heard it looks
like a Kenwood TS-570D but bigger. Not as big as a Icom 756 though. No info on the
possilbity of a remote head. Price has to be in the same ball park as the
FT-900CAT so I guess $1400 ????? A picture of the Radio is in the Ham radio
Outlet Catlalogue Winter
issue. I am waiting for my issue. I may try to visit a HRO store and pick one up.

I asked a guy to "SCAN" the picture and post it to the group. No mention of this radio
on the Japan Yaesu Web Site.

Hi Art, you have some excellent suggestions to minimize desense. The only point that I disagree with is the use of hardline connected onto duplexers. I always use a short jumper of RG214 or 3/8" superflex cable. I have seen many duplexer connectors broken from mechanical overstress. And this is enough to make a grown man cry.
Anyway, this is not a flame, just a comment.

There is a possibility that your receiver may have a spurious
response on your transmit frequency. You can verify this by connecting
a signal generator (adjusted to TX Frequency} to your receiver input
and increasing the signal level until the receiver unsquelches and/or
starts noising up. The resulting generator output level is the
approximate isolation that your receiver front end is providing on TX
frequency and this will provide a practical figure for the amount of
isolation you will need to provide with your duplexers. Sometimes in
dual conversion receivers this unwanted spurious response is in your
last conversion stage and is a function of the difference between
the IF frequency utilized and some product of the transmitter
frequency. Since it is a function of a number of frequency dependant
variables the most practical means of eliminating it is usually to
try another receiver with a different IF frequency. I had a GE Mastr
Pro receiver that was used as a receiver for a repeater pair of
145.27/146.67 and it had a spurious response on the TX frequency.
After pulling most of my hair out for about 6 months, I finally
hooked a sig generator up to it , per above instructions, and found
the problem. The Mastr Pro was a good hot RX but it simply would not
work on the assigned pair.

William DeVore <c7605@worldnet.att.net> wrote:

>Hello:
>What is the key sequence to get my w2a into the crossband repeat mode?
>Bill

It's amazing what arcane informaton the brain can hang on to. I haven't put my old W2A into crossband repeat in years. I was about to search for the manual (hoping I'd written it down), when I picked up the radio and just let my fingers do the remembering. Imagine my surprise when the first key combination I tried worked. It's one of the less tortured combinations, too -- you won't need a hand-chiropractor when you've done it:

Hold the Function key down (above the PTT button)

Press the "2" key, and let go (still holding the function key)

Press the #/ENT/LOCK key.

The Lock indicator "L" will flash in the display, indicating crossband repeat mode.

To get out of crossband repeat, hold Function and press the #/ENT/LOCK key.

3007. FT-50 problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-15 00:00:00 UTC
From: mrusso@hoflink.com
Message-ID: <346e0d06.3234148@news.hoflink.com>
Source record: 161780
Cross-posted to: rec.radio.amateur.misc,rec.radio.swap,rec.radio.amateur.equipment

Hi to all, While playing around with my FT-50 last night. I hit a sequence of buttons (I don't remember now). The display went to a blinking - - - - - . I was able to get the frequencies back but they stay blinking. It seems I turned off the VHF receive, no audio at all, even when the "mon" button is pushed but the little speaker on the LCD display gets displayed. This seems to affect all frequencies from 76-299.99 MHz. It does transmit OK there (ham band) but no receive. The UHF side is OK.
From 300- 999MHZ worked as before. I did a CPU reset to no avail. I reloaded the software also but to no avail. The same thing happens in the VFO's also.
Has this ever happened to anyone out there?? Anybody know how to correct this problem? Please e-mail me direct.
Thanks for your help.

Mark

3015. FAQ: Plectron and Motorola Alert Monitor Receivers

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-15 00:00:00 UTC
From: parnass@bell-labs.com
Message-ID: <64khjb$6th@ssbunews.ih.lucent.com>
Source record: 161831
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.equipment,rec.radio.info

Last changed: October 16, 1997

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150

148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Minimum Volume Setting

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and

feature priority scan and a separate trimmer capacitor for
each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X
SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from
the crystals used in the conventional single channel
Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

Hi John!

>Has anyone made a TNC cable for the FT-50RD from the CT-27 cloning
>cable by cutting one end off? Are all 4 contacts wired through? Are
>the connectors straight or right-angle?

I didn't make a TNC cable but an adapter for a speaker mike. All 4
contacts are wired through, but you don't need them all. The second part (
from the tip of the plug) is for cloning. The connectors are both right-angle.

>73,
>Jon
>

To extend the receiver and open up 800 MHz receive (cellular blocked):

-- Turn off the radio

-- Press and hold the band and squelch buttons.

-- Turn on the radio while holding these buttons,
wait for 5 seconds before you release the band
and squelch buttons.

-- Now the receiver should be opened up as far as it will go.

To enable Crossband Repeat:

-- Set the VHF and UHF frequencies you want to use.

-- "Lock" the radio by holding down the CALL/LOCK button
for two seconds.

-- Turn off the radio.

-- Hold down the SQUELCH button (above the PTT button),
the MAIN button and the BAND button.

-- Turn the radio on while holding these buttons. The "LOCK"
indicator (a key icon in the upper right side of the display)
will be flashing, and the radio will be in crossband repeat.

To disable Crossband Repeat:

-- Hold the CALL/LOCK botton down for two seconds. The "LOCK"
indicator will stop flashing, unless...

-- if the crossband repeater is in use, holding the LOCK button
won't turn it off. If you must shut it off in that condition,
press and hold the SQUELCH button, then hold the LOCK button
for two seconds, and the "LOCK" indicator will stop flashing.

From jones1@alltel.net Sun Jul 20 09:43:46 1997

The mod for out of band transmiting is as follows:

Remove the four screws on the back of the radio and the two screws under where the battery is.

Lift off front of radio(keypad). This is the logic unit.

There is a chip diode at the back of the logic unit. The number is D523. Remove that diode and it will allow transmit out of band on both 2 meters and 440.

Hi all there!

There are, as you probably know, all kinds of modes on shortwave (and
also above)
RTTY, FAX, SSTV, AMTOR etc

Can someone advise me some programs that will work with an HAMCOMM
modem (741 op-amp).
I already have RadioRaft, JVFAX and HAMCOMM (not the PACTOR version)

Im espacially looking for PACTOR, ACARS and/or POCSAG. But any kind of
mode is very welcome.

Thanks a lot for your attention

>I have a TR-7850 that seems to have died.

This has been my favorite rig for alot of years. Absolutely bulletproof so far as intermod goes. I bought an IC-2000H based on its first adv "NO INTERMOD" claims, only to find it gasping when diven thru downtown.
Back to the "7850, what problems are you having? The only difficulty that I have experienced is the loss of memory. This was due to loss of ground integrity, and fixed by tightening all the board mounting screws. Over the years I have needed to do this several times.

Source record: 161849

The equipment should work from day one. There is no reason to shell out money and take a huge risk it won't work. If someone really wants something from MFJ I suggest they order direct from MFJ. Yes they will pay 5% more but they have the option of returning it for a 100% refund "no questions asked". If you bring it back to HAM RADIO
OUTLET they will say they don't sell the products for evaluation and there is nothing they
can do for you. If it is broken they may exchange it so long as it is within the 10 days
from the purchase date, But what happens if the Product doesn't do what it claims but
still "kinda works". That is why you should pay the bit extra and order direct from MFJ.

For a bit more buy the Astron SS-30 power supply. I am an electronic technician with 18 years
of bench work. The SS-30 will "loaf along" and may last longer without failure than using
a power supply that can deliver UP TO 20 Amps. The size is just a bit bigger but you can also power a DSP, tuner,other accessories without concern.

Hello,I have for sale:
Kenwood SW-200 power /swr meter with the swc-1 coupler(1.8-148mhz) & the
swc-2 coupler(148-512mhz).
20/200 watt scale,backlighting & pep lighting with power cord.
No box,but i will pack it well.
Paper work with service manual paper for adjustmets.
On a 1-10 scale it is a 9.
Price is $130.00 shipped to ur door,price is firm,and i will not split
up this package.
I will NOT ship cod.
If intrested please e-mail wy3f@postoffice.ptd.net

From: "Paul S." <pgs@northnet.org>
Message-ID: <346E5EDF.1676@northnet.org>
Source record: 161857

Just got the Yaesu FT-50 yesterday. Ser.no. 7F20xxxx and ADMS-1c
ver.1.07.
1 Will the Ingra-Beton software mod (Change 3 bytes on
the template file useing a hex editor etc.) still work.
And if so, can both the MARS/CAP and the expanded RX range
mod be done useing only the software mods (no unsoldering)?

2 Will the unsoldering blob 1 and unsolder resistor "A"
as described by E. S. Sykes to extend TX and RX still work?

Also I get a CERR message on the ft-50 when I try to make a template
file. I reloaded the software, started it then Radio/Get Data. Bar graf
and instruction appear. I have radio plugged in etc.Push knob and PTT at
same time and turn on power. "CLON" appears. Then I press "PTT". "SEND"
is on for about 4-5sec. then "CERR" comes on. The bar graf on the
computor does nothing. I did the trouble shooting for the ADMS and it
was ok (only AT appears when I addressed COM Port for the ADMS etc.)
WHAT GIVES? One last thing. I had to get an adapter for the com port.
it is a 25-9 pin so the cable for the ADMS would work. Also the interupt
number for that port is in conflict with the modem port but the ADMS
trouble shoot should have cleared that up and the modem was not used.
Paul

Mike

3043. MFJ: Good or Bad

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-15 00:00:00 UTC
From: km1h@juno.COM
Message-ID: <19971115.174124.9687.2.km1h@juno.com>
Source record: 161859

My feeling about any MFJ product is that it is made with price as its leading feature. Quality or adherence to the ridiculous advertising hype is secondary.
I see now where MFJ has managed to con the magazines into publishing glowing testimonials.....gee I wonder who wrote the "press releases"?

I suggest that any potential buyer try and find an honest employee at a dealership and ask some questions. In this area it appears that MFJ is a "leader" on the return goods shelf.
Their earlier 989C tuner has been reported as catching on fire at only 900W on 75M. Not suprising for something that uses a Delrin core for the roller inductor. The latest version, and the ads, hype the new air wound coil. Great idea, no more fires but read the March 1997 QST review and look at the efficiency on the low bands. The only difference is now the coil just gets hot and doesnt nail you with toxic fumes.

I used to also sell MFJ products but had to stop because of the return problems; this was in 1986-90 so I guess nothing has changed.

The 259 SWR Analyzer works up to a point, the harmonic content of the output prevents accurate measurements in many cases.....something the mindless reviews in 73 and the like miss. I finally got a working one on the third try, used it for a month and sold it.

Their packet controllers are a laugh; after many years and using the buyers as guinea pigs they finally got some of the bugs out. That holds with so many of their products. Good ideas but horrible execution.

Take a close look at the reviews of their various xcvrs....drift, poor TX IMD, overload prone receivers, etc. Heck for the same money you can buy an older real radio designed by real engineers, not contract labor.

I could go on but to what point? MFJ has set on a course to destroy any competition and be King of Garbage in the ham world. It is a sad commentary that so many hams fall for it and are so dollar conscious and quality - specifications brain dead.

Cheers Carl KM1H

I've had a 986 differential tuner, I've found at least their high stuff to
have decent QC. The low end stuff could use better QC though. All in all I'm
happy with their stuff.

Offhand I remember someone mentioning a similiar problem. From memory the source of the problem was the squelch setting, apparently if the squelch is set too high or too low it ill cause problems iwth the ADMS software. At least that is how I remember it.

3047. VX-1R the real mods !!!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-15 00:00:00 UTC
From: Ingra-Beton@t-online.de
Message-ID: <64kbqg$8vi$1@news00.btx.dtag.de>
Source record: 161863

```
The VX-1R Software and Hardware mods ( Version 1.00, Date: 14.11.97 )
======================================================================

Some time ago some mods for the VX-1R from YAESU were released on the
Net (Solder Jumpers 0 and 1).

In the US they are working (because by accident you switch to the
FreeBand Country Code 000 (US is 011), ARS is disabled) but in Germany
(Country Code 101) with soldering Jumper 0 (1 already soldered) you
Switch to Country Code 100 and get something totally different :)

You don't understand ?, keep reading :)

In the following Text the meaning of the 6 Jumpers is explained and
I present the Software mods for the VX1R. This is very simple, fast
and easy done, you just have to change 1 (one) byte in your .TPL file,
you don't even have to open the VX1R but you need the VX-1R Programmer
from the ADMS 1D Software Package.

After I have released the Software mods for the FT50R, there was a lot
of confusion, there were to many terms like Key_Byte, Band-Set_Byte,
Sub_Band-Set_Byte, ... to many addresses , ....

This time I will not go into details, and will try to keep it as simple
as possible, ONE Address and a Band_Set-Byte only.

The Band-Set_Byte is identical to the 6 Jumpers on the VX-1R:☐

Jumper 0 = Country CODE 1st bit ---------------------+
Jumper 1 = Country CODE 2nd bit -------------------+ I
Jumper 2 = Country CODE 3rd bit -----------------+ I I
Jumper 3 = WIDE TX ----------------------------+ I I I
Jumper 4 = CELLULAR -------------------------+ I I I I
Jumper 5 = WIDE RX ----------------------+ I I I I I
I I I I I I
Band-Set_Byte (8 bits) = 1 1 X X X X X X
I I
Reserved

Country
Code
2 1 0 VHF TX UHF TX VHF Auto rep. Shift UHF Auto rep. Shift
----------------------------------------------------------------------
0 0 0 Free* Free* none none
0 0 1 144-146 430-440 145.600-145.800 -0.6 433.000-433.375 +1.6
0 1 0 144-148 430-450 146.605-147.000 -0.6 438.025-438.725 -5.0
147.005-147.395 +0.6 439.275-439.975 -5.0
```

```
0 1 1 144-148 430-450 145.100-145.495 -0.6 440.025-444.975 +5.0
146.000-146.395 +0.6 445.025-449.975 -5.0
146.600-146.995 -0.6
147.000-147.395 +0.6
147.600-147.995 -0.6
1 0 0 144-146 430-440 none none
1 0 1 144-146 430-440 145.600-145.800 -0.6 438.200-439.425 -7.6
1 1 0 144-146 432-438 145.600-145.800 -0.6 433.000-433.375 +1.6
1 1 1 144-146 430-440 none 439.000-440.000 -5.0

*Free (TX: 108-222 and 300-560)
BC Band - No TX
FM - No TX
AIR - Full TX
V-HAM - Full TX
VHF-TV - Full TX
ACT 1 - 300-420
U-HAM - Full TX
UHF-TV - 470-560 (approximate 562-565)
ACT 2 - No TX

WIDE TX ( enable 1, disable 0 )
------------------------------------------------------------------------
Enable/disable WIDE TX from 140-170 and 420-470 (MARS/CAP)

CELLULAR ( enable 1, disable 0 )
------------------------------------------------------------------------
Enable/disable the range 824-849 and 864-894

WIDE RX ( enable 1, disable 0 = see below)
------------------------------------------------------------------------
BC Band - Enabled
FM - Enabled
AIR - Enabled
V-HAM - RX Enabled only in TX range according the country code.
VHF-TV - Enabled
ACT 1 - Disabled
U-HAM - RX Enabled only in TX range according the country code.
UHF-TV - Enabled
ACT 2 - Disabled

You can make the mods by Hardware (solder the Jumpers) and call the
INIT routine (hold down AR and M/V at powering on, and press FW)
or by Software, you need the VX-1R Programmer and you have to change
only 1 byte (a 10 seconds job) in the .TPL file, no Init is required.

The results with the Hardware and/or Software mods are 100% identical
and 100% reversible. The only difference is that with the Software
mod you will switch back to your Hardware Configuration by calling the
INIT routine.
```

According to some messages in the past days, YAESU is removing the diodes from the VX-1R to disable the Hardware mods, so the Hardware mods may not work in the future Versions of the VX-1R, then the Software mods will be the only Solution.

If you are using Hardware mods, note: 1=JumperOpen, 0=JumperClosed

If you are using the Software mods, it is not importuned what Hardware configuration you have (read: mods you have done), you can simply switch to ANY configuration.

Example:
7 6 5 4 3 2 1 0 (Jumpers/Bits)
Bits 7 and 6 are reserved 1 1
Enable Wide RX 1
Enable Cellular 1
Enable Wide TX 1
German 1
Country 0
Code 1

Band-Set-Byte 1 1 1 1 1 1 0 1 = FD (HEX Number)

Well, make now a .TPL file and change with a HEX editor the Byte on address 114C to be FD, upload this .TPL to the VX1R, done.

So, I thing the mods are understandable now, with this method you can configure the VX1R exactly according your needs.

The most used mod will probably be to enable WIDE TX, so the Auto Repeater Shift is still working, the TX outside the WIDE TX (with the FreeBand Country Code 000) is anyway only in miliwatts in VHF (not useful) and a little bit better in the UHF range 340-420.

A wise solution may be, not to make any Hardware mods. You make the Software mod (Enable WIDE TX or FreeBand) and in a emergency you can switch to the unmodified (factory) configuration by the INIT routine in just 1 second (hold down AR and M/V at powering on, and press FW) You know, just in case ...

That's all folks, for now :) , there are some other interesting things, but I want to experiment a little more before I release them.

If you have any Questions, Email me.

73's to all.

PS. - Thanks to Mark Russo for his great Help, ...

- Greetings to all my Friends in Skopje, Mazedonia.
- CQ CQ CQ Z3HAN, still ill ?, you should eat Cheese from Berovo :)

I've had good fortune as well. Twice I've actually talked with Chip W7JA.
And it was about a FT101zd that I had purchased second hand. I've never had
that kind of service form Kenwood or Icom even when I bought item from them
that were brand new.However I've noticed that Kenwood's ham tech support is
trying to improve.

>Brian, what happens if the fuse blows in the negative lead going to the
>battery? The current could now take path through the coax, right?

Nope. There will be no current because now there is no connection to
the battery negative. That's what the fuse does, it breaks the battery
negative connection if the normal battery negative strap fails and leaves
the radio negative as the only return path for things like starter current.

>The current could then find a path thru the radio thru shielded conductor
>of the coax, right? Not good! Imagine starter current trying to go thru the
>radio.

That's what it would try to do if the fuse weren't there. The fuse *breaks*
that path back to the battery and prevents that sort of occurance. No currents
will flow if there isn't a complete path from battery positive to battery
negative.

The only reason that there is a potential for a problem in the first place is
that the radio negative and radio coax shield are commoned via traces on
the radio circuit board. If the battery negative strap to the frame parts,
then the only path back to battery negative for currents is via the body,
the coax to body connection at the antenna, the coax, the ground traces
on the radio circuit board, and the radio negative back to the battery.
If that lead has a fuse, it will blow if this happens, and no harm is done.

OTOH, using a frame ground will ensure a ground loop. Radio negative
will be modulated by the other vehicle loads sharing the same return path
impedance. This is bad, and causes noise in the radio. That's why you want
to run the separate radio negative lead directly back to the battery. That

eliminates the ground loop and eliminates the noise other loads cause in that loop. But you do have to fuse the lead to protect against the chance that the battery negative to frame strap should fail and leave the radio negative as the only return path to the battery.

Come on, this is DC, it isn't that hard.

Put a 12 volt light bulb in series with the power supply to limit the
charging current. When the light bulb goes out or gets real dim you
know
it's close to full charge.

3053. ICOM 350 Hz Xtal Filter any good?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-15 00:00:00 UTC
From: jdonimi@aol.com
Message-ID: <19971115140300.JAA00975@ladder02.news.aol.com>
Source record: 161869

I have an IC-706 and am shopping for a crystal filter. I notice from the AES catalog that there are now 3 choices:

1. FL-100 500 Hz $99
2. FL-101 250 Hz $99
3. FL-232 350 Hz $90

I've always thought that 250 is too narrow and that 500 is, perhaps, a bit too wide. 350 may be just right for me.

Why is the 350 Hz filter less expensive? Is it less of a filter (weaker skirts, less ultimate rejection)?

Usually ICOM people are great, but - luck of the draw - the tech rep I spoke with yesterday didn't know anything about filters.

Anyone know about the relative quality of the FL-232 350 HZ crystal filter compared to the 500 Hz model?

You might try a noise canceller like the ANC-4, but to really solve the
problem you need to get on your power company and have them fix
the problem at the source. The noise is usually caused by arcing over
loose pole hardware or across cracked insulators. The power company
is interested in getting these problems fixed because they can lead to
failure of the transmission line, and that costs the power company
big bucks in lost revenue.

(I was shocked to find out just how much lost revenue is involved in
only an hour's downtime to a distribution line. It's now obvious to me
why the power company is so eager to prevent this sort of loss.)

If the line is an EHT line, IE big metal towers, then the noise may be
due to corona noise. The power company may not be able to totally
solve that, so you might give the ANC-4 a go at that point. But give
the power company a chance first. They can usually totally eliminate
line noise. It may take them a while, but they are interested in fixing
this sort of problem.

The battery is probably shot. A regular lead-acid battery is usually a goner if the voltage falls below 10 to 11 volts. I would expect the same of the gel-cell.

It's worth a try running it on the charger for a while, but don't be surprised if it doesn't revive.

I wouldn't put diodes in the lines. The voltage drop may prevent you from bringing the battery up to proper voltage even if it is still good. A low-value resistor or 12-V light bulb will moderate the current, and you can make rough current measurements by measuring the voltage drop across it (Ohm's Law: I = E/R). The resistance of the light bulb will go up if the current is very high (bright bulb), so the measurements won't be accurate, but they're cheap and easy, and they give you a rough value.

Several responses hit the nail on the head. One said" Don't know
how hams got along without the 249 Analyzer" Amen.. One response referred to an
all band vertical, a short vertical can't
perform like a full-sized up in the air dipole.
I consider MFJ products in general to be practical items in a plain
"Brown Wrapper". To the great credit of the company, you can
upgrade a product at modest cost, ie: a 249 analyzer can be upgraded to a 259
for inexpensive money. That alone is good
reason to give their products serious consideration.
I have quite a bit of MFJ, and I'm happy with it. 'So there, Mr Jue.

Need a peak reading power meter, prefer it to be able to handle full power
(so it can loaf at 100-500w). 160-10 Meters.
I believe that the SWAN WM-3000 fits the bill, and would be preferred as it
will match my Swan rig, but will consider most anything.

I prefer a trade, but cash is an option.

Source record: 161910

I plan to purchase an ICOM 706MK II to use during a trip to India next year. I was planning to purchase the matching ICOM PS-85 Power Supply. One of the dealers I talked with about the power supply indicated the following:

"almost everyone is using an Astron SS25 power supply instead of the PS85 which is plagued by birdies in the HF bands and the price is only $129!"

Does anyone have any experience using either the PS-85 or the Astron SS25 with the ICOM 706MK II? Is the PS-85 really plagued with birdies? The price for the SS25 is sure lower, but are there any disadvantages with using it instead of the PS-85?

Any information would be appreciated.

Thanks,

Gene, WI7N

Hi Tom, you could try one of several noise cancelling devices on the
market. They work by taking a sample of the interfering noise (picked
up by a small sense antenna) reverse the phase of the sample and then
add it back to the original signal thus cancelling the noise and leaving
the wanted signal intact.
They do work well but may require some experimentation with the sense
aerial to achieve the right level of signal.
A commercial version available in the USA is made by MFJ and is the
MFJ-1026. In the UK it retails at 140 UKP but is bound to be much
cheaper in the USA.
good luck, Trev G3ZYY ...-.-

Hi Tom,
My suggestion if you have not done so yet is to first contact the power company.. tell them it's interfering with your radio, tv. etc.. they will usually come and tighten up all their hardware and that usually will take care of the problem..

The VX-1R is fun, but as you say it often isn't powerful enough for
use in the car (where it can run 1 watt when powered off the vehicle
electrical system). But then most 5 watt HTs aren't powerful enough
either. I suggest you spring for a real mobile rig which can deliver
45 watts or better. That's what you need on a trip where you'll be
dealing more with fringe repeater coverage. Other repeater users
will thank you for not imposing a handi-scratchie on them. And
you'll love the much better audio so you can actually hear it over
road noise.

Reserve the HT for foot mobile occasions where fringe coverage
isn't an issue. The VX-1R is terrific for that. If you get a dualbander
for the car, you can even use it as a remote base for the HT, so
you'll still have good coverage when you're foot mobile. That's
the ideal setup.

But if you insist on owning only a HT, then the Radio Shack
HTX202 is the pick of the crop. It offers as much power as
you can expect from a HT coupled with a tight receiver front
end which rejects pager crud when you use an external antenna
on it. Cheap too, when it's on sale.

I've bought, and still buy, MFJ equipment. You have to realize going in that you are the final QC department, and that you are going to have to redo some of the mechanical assembly and correct some of the horrible soldering. But with that in mind, you get good value for the money.

MFJ offers you things which would be totally out of sight if bought from a high quality manufacturer. The exchange for that is that you have to put a bit of sweat into getting their stuff to work. That's often a fair trade. Once you fix the problems, the equipment is generally servicable and useful. Some of it is downright clever.

I agree! Several of the things I bought were "dead on arrival"
and I had to exchange them or repair them myself. But once repaired, they
worked. I do hope he gets the quality up.

Hmm. You're feeding a balanced antenna with an unbalanced tuner
and you have RF in the shack. Now why could that be? Could it
be because of the lack of a balun to prevent common mode currents
on the feedline? Yep, could be.

Even though the tuner provides a negative which is isolated from
its chassis, it isn't isolated from the coax shield, and the matching
network inside the tuner is still an unbalanced Pi section, so you
still need an unbalanced to balanced transformation to feed the
balanced antenna. The tuner would need to be an H or O network
internally to feed a balanced antenna. It isn't. So you have to have
the balun or you'll have common mode feedline currents and RF in
the shack.

The proper place for the balun is right at the antenna terminals, but in this special case where the tuner is literally a part of the antenna feedpoint, you can get away with using a choke balun on the coax where it enters the tuner. (Choke the tuner power wires too.) That'll get rid of your hot shack problem provided you aren't also getting induced currents on the feedline from poor routing with respect to the antenna. If the latter is the case, reroute the feedline at right angles to the antenna. If you can't do that, try changing the feeder length and/or add another choke balun near the shack.

>nick.
>Dave G1ypd.
David,
The two years in Nick is the max that can be thrown at you. I have only
ever heard of a 3 month sentence being given out and that was in the
good old days of an assault on one of the radio inspectors.
On the other hand, even Eric Gotts was once busted for assaulting a
pirate, and formally charged and found guilty in a court of law!
May I suggest that you're never going to rid the airwaves of illegal
broadcasters, you're not even going to keep them in check. In recent
years much of the funding has been withdrawn from this end of the DTI
budget, they are but a shadow of their former self.
We had interference on our business repeater(for which we pay a
substantial yearly fee to the RA) and they were totally useless. As
there were criminal repercussions involved, the local CID ended up
apprehending the culprits once I had tracked them down with a Datong DF
unit, one of the two fellas is now doing 8 years.
The RA is a waste of time. They got a bollocking from the chief
superintendant of the county's CID.
Just let everyone have freedom of the airwaves then there'd be no
problem.

Phil G4ZOW/M

This "should" be an avilable service from your local Library. Even if
the local library doesn't have the particular issue, they should be able
to get copies of the article through the Inter-Library loan system.
Works 100% of the time here in Kansas ... and we ALL know how backwater
Kansas is! <grin> Of course this does mean that you must have a CURRENT
Library card .... normally FREE, as is the Inter-Library loan service.

You might try:

C.W. Wolfe Communications
1113 Central Ave.
Billings, Mt. 59102
406-252-9220
FAX 406-252-9617

They frequently have manuals avilable. Cost is in the $25.00 range,
which is also their minimum order. May also still be avilable from
Motorola direct. Part # is 68P81015E70-H for the UHF Micor manual.

Sencore Model TC162 Mighty Mite VII tube tester, with manual. Compact, about 10" x 11" x 5", works great, with manual. Tests octal, loctal, 7 & 9 pin miniatures, sweep tubes, etc...
The case is in pretty bad shape, but it would be easy to make a wooden case out of 4"x1/2" framing boards.
Price delivered in lower 48 is $35.00, via UPS.

Source record: 161741

The only meaningful question here right now is what you are getting out of the driver. If you are getting what the driver should be outputting, then your problem is in the final, if not then go back up line.

If you are getting what you should out of the driver, before replacing the finals check the feedback protection circuit to be sure it isn't choking things off due to a failure therein.

Also, are the finals getting the correct voltage and current, or has something failed in the power regulation and supply circuitry?

The very last thing to do is to replace finals that you have no evidence to believe have failed (since they are also the more expensive component.)

Just a few guesses ... 73, DavidC AA1FA

From: J Bergma <antispamm@worldnet.att.net>
Message-ID: <64nrn4$l9f@bgtnsc02.worldnet.att.net>
Source record: 161742

I have 3 minitor I monitors on VHF low, one pager has a bad volume control.
Two of the pagers look like new, the other one shows significant wear.
I have 5 drop in chargers, 3 of which have the antenna connection's.
Chargers are discolored somewhat as they look like the were in a smokers
environment.All the chargers work.
Would like to trade for one minitor II on VHF low with a drop-in charger.
Regards,
Jody

That too. My point still stands, and that is that most hams are BORING, at least on the air. The FCC prohibition on broadcasting by hams reduces most hams to making small talk with buddies on air and engage in a sort of *my dick is bigger than yours* race (figuratively speaking, of course). If hams could broadcast programs to the listening public, more people would want to be hams and more people would want to listen to SW. And to all the hams who hate the concept, let me remind you that the first amateur stations DID broadcast to the public. KDKA, KCBS and a handful of very early broadcast stations were licensed as amateurs because there was no law allowing for general broadcast licenses.

I was very pleased with Virginia Power (Fredericksburg, VA) several years ago. I called and talked with their "interferrence technician". He came out with a truck equipped with a directional antenna and receivers that would tune 100 Khz to 300 Mhz. He found an old type insulator being used and had all of them in my local replaced. He even went onto the military power station down the road and checked to see that it wasn't causing any problem.

If your problem is intermittant, make a recording of the noise so you can play it for the technician. If you get interferrence "speckles" or rolling dark and light horizontal bands on your TV, (the lower channels 2, 4, 5 are usually the worst), make a recording of it on your VCR so you can play it for him. The bands are very helpful because it proves that the interferrence is syncronized to the power frequency. The goal is to convince the technician that your interferrence is comming from the power lines, and not some other source. Of course, if the intererrence is there when he is around then you have it made in that department.

My experience with noise blankers and such is that they are not very effective against most power line noise because the pulse width is too wide. Most of these devices are designed to handle very narrow impulse noise such as automotive ignition.

Good luck

Bob

For Sale:

1) Hustler 6BTV all-band (60 thru 10 including 30M) vertical antenna. Used 1 month and then carefully disassembled and put back into original box. No damage, clean, works great. The wife just didn't like it sticking out of the ground in the back yard. $110 + Shipping.

2) Bencher BY-1 iambic CW paddle. Very good condition. $40 + Shipping.

3) MFJ-564 iambic CW paddle. Like new in original box. Chrome plated base, red paddles. $40 + Shipping.

4) MFJ-1272 MYV packet/microphone switch. This accessory allows you to have your TNC and mic hooked to the rig at the same time. A front pannel switch allows you to change between the TNC or Mic wit the push of a button. Also, the 1272 makes it easy to hook your KAM to a Yaesu without any soldering. Includes necessary cables. Like new in original box. $25 + Shipping.

5) B&W "Model 600" Grid Dip Meter. Excellent diagnostic and design tool. In very good condition. Includes coils covering broadcast to 240Mhz, wooden case, manual, spare tube. $45 + Shipping.

6) SURE 488T Noise Cancelling Microphone -- Transistorized hand mic that is FAA certified for Aircraft application (TSO-C58) Frequency response from 200 to 4 KHz. Low impedance dynamic (100 to 220 ohms) element. With Neoprene coiled cord and data sheet. Ready to be wired for your application. Used, but clean. $25 + Shipping.

7) TUBES -- Quantity of 96 tubes. 37 of them are in original tattered JAN boxes. Numbers like: 26C6, 6CZ5, 6DJ8, 6BL8, 6B8, 12K8-Y, 12SK7, 12A6, 12SQ7, 6J5, 12SR7, 6L7, 26V6, 26A6, 26FZ6, 26D6, 6AL5, 12AU7, 6AJ5, 12SA7, 12SJ7, 12SA7Y, and one (1) 4X150D transmitter tube. All tubes have been tested on a TV-7 military tube tester and found to be good. All 96 tubes for $40 + Shipping

Thanks,

This will be short because everything is available on our web site and to
avoid a long download.

##################################
THE RCI FEDERATION ANNOUNCES
##################################

RCI-ROM 1.1
A CD-ROM for RCI 2950, 2970, 2980, 2990, Saturn, Satutn Turbo and similar
rigs owners.

All the mods well explained with texts, photos and videos
No a simple listing of Howtoos but a real multimedia product with menus,
musics, sounds...

Multimedia part:

Full Diagram: Main Board + CPU board + Microphone Encyclopedia
Full listing of all the components
Full table of voltage values
Full table of frequencies - channels
Full alignment procedures
Repair tricks, errors, enhancements...
Plenty of mods with photos, videos, voice explanation....
Extreme mods "for transverting to other bands" chapter
A full DX Guide with beaming utilities & programs
A Rci Packet chapter: How to practice Packet with your rig
A complete information on the RCI Federation, the full collection of
already published RCI Newsletter...
The RCI BIBLE 3.0 beta (exclusive)
+ Over 1500 mods for other rigs (Ham and CB radios)

Video part

Component section ID
Internal Controls ID
Channel conversion on new 2950, my old one got stolen.
MRF477 intro and removal of 2SC2312's
MRF477 pin reconfiguration.
MRF477's installed and AMC transistor location.
Observing the radios output on a scope and wattmeter.
Introduction of the Heavy swing modification.
Candlewax (just watch it!)
Observing the effects of the swing kit modification on the
Wattmeter and scope.

Disassembly of the radio.

and much, much more.....

The needed computer will be:
486DX2, Pentium, Pentium Pro, or any other compatible
RAM: Minimum 8 Mb - Hard Drive: 20 Mb free on the disk
Video: 800x600 VGA or upper
A CD-ROM reader 4X & a SoundCard
Everything is in English.

Price: $35
- Credit card Visa/Master Card
- Cash
- Mail orders
- Resellers and importers, please contact for other payment protocols.

Date of release: 30 October 1997. AVAILABLE NOW !!!
We directly deliver 96 Hours in any country and we are looking for local resellers or importers. Please advise.

There is a beta version available at our web site: http://rciweb.cadic.com (9 Mb in a EXE autodecompressing file).
This CD-ROM is the product of an international collaboration (France - USA - UK)

I have a MFJ259 SWR analyzer that I use in a commercial application. While it is not used everyday, it works when you need it and is fairly accurate. It is ideal for checking low band mobile antennas inside a building. I have had a few of their other products and they all seem to be worth the money. They are not the most heavy duty products but most hams can't afford or even need the real expensive commercial stuff.

3123. Is Icom 350 Hz Xtal filter any good?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-16 00:00:00 UTC
From: jdonimi@aol.com
Message-ID: <19971116044501.XAA24334@ladder02.news.aol.com>
Source record: 161787

I notice that Icom offers 3 crystal filters for the IC-706.

FL-100 500 Hz $99
FL-101 250 Hz $99
FL-232 350 Hz $90

The 350 Hz bandwidth may be just perfect for persons like me that believe that 250 is too narrow, but 500 is too wide.

Only thing - why is the 350 Hz filter cheaper? Do you get less of a filter (filter skirts, lower ultimate attenuation) with the 350 Hz model?

I called Icom yesterday, but - luck of the draw - I got a tech rep who didn't know anything about crystal filters. Usually Icom employees are great to work with, but not this time.

Anyone know the answer? Anyone use the 350 Hz filter?

>can do to filter this noise out?

Tom, any power line noise that is "excessive" should be reported to
your power company. Unfortunately, your report and complaints will
not get much priority - especially if they think you aren't important.

I went through a year-long process with Virginia Power and finally
won. They finally yanked two lightning arrestors on a HV line that was
"two blocks" and 1/2 mile respectively, from my home that were giving
me S7 to S9 grief during most daylight hours. I kept detailed records
of all my telephone conversations and FAX's to them, collected names
and telephone numbers, invited them to come and take a tour through my
QTH, and I kept steady pressure on them at least once a month. When
the right guy took up my case, it was all over withing two days. and I
now enjoy an absolutely quiet 80M and 40M band.

One thing you will need to establish using a mobile rig, is that the
noise is indeed excessive (in relation to other comparable and similar
situations) and that it is localized (in other words, if the noise is
at the same level everywhere over several square miles of area, you're
probably out of luck). The source of the noise must be sufficiently
localized that they can see a limit to the scope of their problem.

In my case I was able to localize it to a specific pole using the
mobile rig plus a transistor portable AM/FM receiver.

3132. HTX-100 repair -- HELP!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-16 00:00:00 UTC
From: wilkinc@videotron.ca
Message-ID: <346f9466.26940336@pserver>
Source record: 161796

Hi.

HTX-100. About 5-10 watts out on CW. SSB has pretty much no power, needle moves a bit when "yelling" in mike. Driver and Final RF output transistors look okay on diode check (b-c b-e). No shorts or opens.

Replaced driver anyway ($5) no change. Final costs $49. Wanna be sure before buying part...Question is, can RF transistors look okay when checked with ohmeter but not work in RF circuit??? MRF477 even looks "ok" when check with transistor curve tracer...But is that a valid test for an RF transistor...

Thanks!
Ve2CWN

Source record: 161800

Hi Kenwood users, just want you know, that we got them in and they work perfect. I never had a radio which was really so wide in tx function. it works with high power also on 170 mhz, and the 900 mhz rx is very sensitive. i compared it with the ax400 from standard which seems to be the best for 900 on the market. it is easy to modify for wide tx. the e-version has full 300 and 900 mhz receive, but it seems the a-version for the us has different processor with blocked range. just to let you know... it is great.. best wishes from germany

Looking for any mods at all for Alinco ALD 24T.
Especially for the recieve end.
bgriffin@galstar.com

3147. Need Specs, Schematic & Pinouts for MFJ-1278 Please

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-16 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bcf29f$893c8d20$0e8a92d0@bitnet.bit-net.com>
Source record: 161811
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc

I understand that the 1278b manual is 170 pages, I guess the 1278 is close to that ... wow! I just need the specs, schematic, and pinouts from the 1278 manual. (I understand also that there were multiple versions of the 1278, how does one determine which one has?)
If someone would list the proper specs for the 1278, or tell me how to get the 1278 to tell me what they are, it would be much appreciated!
I'll pay reasonable copy and postage as agreed in advance, or you could scan them and E- mail them as an attachment, or fax them to me at 617-674-2824 (Please be sure to put "David Colburn" on the fax as there are 4 Davids at that number!)

Reprinted from from The ARRL Letter Vol 16 No 45

* Bogus bulbs? Merit Arnold, W6NQ, of RF Parts in San Marcos, California, asks in an Internet posting if anyone has encountered counterfeit high-power transmitting tubes (eg, 3-500Z, 3-500ZG, 4-400 series) at flea markets or through overseas suppliers. He says that since Eimac left the glass tube business, he's learned of instances where Eimac and Amperex logos and cleverly copied markings or labels have been applied to tubes manufactured in China which are then packaged in yellow Eimac-style or Amperex boxes. Arnold says that recent-issue Eimac 3-500Z/ZG tubes will have the Eimac logo imprinted on the grid shroud. Also, he says, Eimac will usually have the serial number engraved with vibrating pencil on the shroud. On the other hand, the counterfeit overseas tubes will have the date code and serial number stamped along the edge or on top of shroud (first two digits indicating year of manufacture). Counterfeit 4-400 series "Amperex" tubes use a "slip-on" anode terminal with a set screw. Genuine Amperex tubes have the terminal fused through the glass. W6NQ would like to hear from anyone who has run into these bogus tubes. E-mail him at rfp@rfparts.com.--thanks to Marv Gonsior, W6FR

> Marvin W2AH/6 marvin@linkline.com

Eric - The noise blanker is as effective as the NB feature in any of the
top-of-the line K, Y or I
brand radios. I have not noticed any intermod problems.

The only feature I am not keen on is the speech processor. I find
it difficult to adjust, so I
have been using a Datong (UK) outboard rf processor running at 6db
processing and
the reports are good and it looks good on a scope monitoring the
output coax to my
antenna.

Kachina tells me thy are coming out with these new features in
eatly '98 or before:

1. An outboard knob for those who must have a conventional tuning
control.
(I have gotten used to digital tuning, and I don't feel this
feature is needed, but
I'm sure it will be a good selling features for many hams who
"have to have a knob to
twiddle.")

2. Provisions for using the keyboard for sending Morse (and
presumably the digital modes.)

3. Full remote site control. I had a remote site which I linked
via 1.2 gHz or telephone,
and it solved my local restrictive deed covenent restrictions

- - - a vy common problem
here is So. California.

That's what Er2 means, and trying to run high power with an external power supply while using the rubber duck antenna is the usual cause. But you don't have to return it to RS for service. Just to a full reset, instructions in the manual, and all should be well unless you do it again. (When operating off external power, always use an external antenna.)

Now if the full reset doesn't fix it, you have a genuine PLL problem, and you'll need to send it in to be repaired.

>73 de W9DMK

Yes Bob, few utility groups have the tools to find the defective components that cause the grief. Over 40 years now at all this, I've learned what you have also learned. If you really want to get the noise problem fixed, do two things.

1.) Acquire or borrow the tools to really narrow the search down to a specific pole or component. Portable rx, loop, small beam, even an ultrasonic directional microphone/down converter affair to listen to the corona can be fun (You'd be surprised to find out what insects sound like!)

2.) Develop a friendship with one of the key supervisory level people who is willing to learn that you do have access to the tools and know how to reasonably narrow down the search to the bad component. On several occaisions, for example, I've lead these folks to circuit breakers that were tripping for no apparent reason to them! They are mysterious outages to them, but to my 80 meter 4 square, they are pop, pop, pop pop, once every few seconds or so from where they are arcing inside in the oil

filled cases! A mobile rx with a loop and a vhf hand held
with a small beam work wonders on this stuff. Incidentally,
the bad sites I have found for them have been as far away as
four miles from my QTH in the country!

You may also discover that your neighbors have devices in
their homes that are terrific noise producers and very tiny
things. These fan and light dimmer triacs can cause BAD
noise. You don't want to get the power company out on
deals that are not their deal either. Finding out that one
of these deals is in your own place before the power crew
tells you that it is becomes of paramount importance if you
want them to hop llike a bunny the next time you squawk!

Those things done, I've found that at least three different utility groups here
are HAPPY to get the stuff fixed VERY quickly. They don't want any of
the bad components in there any more than you do. Leaky components
are just service faults waiting to happen and can waste power as well.

Most of the groups, since they don't have the tools and the people to go
find the stuff are tickled to death to find someone that can do the job for
them that is sincere about the job. A couple of "finds" and fixes into
the deal and you will have real friends in these groups.

This said, a word for the original poster...

Why don't you visit one or more of your local ham radio groups?

See if you can strike up a little interest in the DF afficiandos.

You will likely find that POOF... there sare a crew of people out
the in the ham world that are much more interesting and capable
than the average crew in the CB world. If you like what you see
when you do this...

You might even go down to Radio Shack and get a vopy
of "Now You're Talking" and we might suddenly find a
new enthusiastic ham operator in the ranks... :)

ok... I have something that may be interesting to you...

Within last 24 hours (212 access), the access to my web page was the
following:

OS:

- 84% Windows 95
- 10% Windows 3.1
- 1.5% Windows NT
- 1.5% Macintosh
- 1% Unix
- 1% Linux
- 1% Sun OS
- 1% Others

Browser:

- 45% Explorer
- 55% Netscape (23.5% Netscape 4, 23.5% Netscape 3, 6%
Netscape 2, 2% Netscape 1)

around 10% of internet users are still using Windows 3.1.

Hello Mike,

I'm glad you added these points:
> You may also discover that your neighbors have devices in
> their homes that are terrific noise producers and very tiny
> things.
> Finding out that one
> of these deals is in your own place before the power crew
> tells you that it is becomes of paramount importance if you
> want them to hop llike a bunny the next time you squawk!

Because I had forgotten to mention them, and they are terribly important. I would like to add "Touch Lamps" to this list of RF Noise producers. Surprisingly enough, they radiate essentially the same amount of noise whether they are turned on or off.

I can't really agree from my own personal experience, that the power company believes that these problems are worth fixing from their own point of view. It may well be the case, but the people that I talked to didn't seem to give that any priority. But eventually, you find someone who is actually interested in the complaints of hams and commercial businesses who use radio communictions.

YES- this is an auction
YES - I do have good feedback for over a year!
YES - you must be registered at Ebay to bid (free)

Closing today!

Lot of 4 VHF GE Century II Mobiles. I bought these thinking they were UHF, but they are VHF. I don't need them. They are at least 25 watts, and are direct FM modulatable (good for making a repeater transmitter). I have no accessories for these,(which means no mics, power cords) but they should work. Great for packet or a repeater start. I have not tested these, so they are being sold AS IS. 12 VDC. Non-smoker. Buyer pays shipping of $9 in USA. MO, COD(in US only), or cleared check okay. Question? Email wj9jrg@utc.campus.mci.net

Thanks!

Andy

Source record: 161826

The Texas Towers calls the radio the FT-847 while the HRO web page and Catalogue call it the FT-846 .
I believe it to be the same exact radio. There is no info on the Yaesu Japan, UK web page so I cannot give you anymore info.
I heard Yaesu will finally be closing out the FT-900CAT by spring for this new "ANIMAL RADIO". So I guess the price will
be around $1400-$1500 dollars. The intro price may be $100 higher ($1600) for the GUYS who have to be the first on the block to own one. Also, this radio will compete directly with the ICOM IC-746 HF-6 mtrs plus 50 watts on 2 meters plus spectrum scope.

Hi there, I recently purchased a radio with Lithium Ion rechargeable batteries.
I am familiar with Ni-Cd and Ni-Mh batteries. Can someone help me with the care and feeding of Li-Ion batteries. Do they like to be cycled? Can they be damaged by temperature extremes? Can they be floated for long periods without damage? What type of charging do they like(constant voltage, constant current, neither)?

Does anyone have some good bookmarks to point me to?

Thanks

> more interesting, precludes sharing the spectrum.

Well, I'm not saying that everybody would broadcast 24 hours a day, of course. Most people don't have the resources to. And even the big SW broadcasters don't stay on the same freq all the time.

> Amateur Radio isn't about broadcasting... it is a hobby that promotes
> experimentation and public service (for starters), with "broadcasting"
> specifically prohibited for the good of all.

No offense, but that's a joke. Most hams I know use storebought equipment and spend most of their time yakking with other hams about stuff of zero consequence. I know pirates who are more experimentation oriented (in both their equipment and their programming) than a lot of hams. Besides, broadcast stations can serve the public interest too, although most of the big ones don't.

> I don't disagree with everything you have to say, but I don't agree
> that we need to change the current prohibition on Amateur Band
> "broadcasting" in order to attract more amateurs.

Do you think a night of listening to 3950 will attract hams?
>
> It isn't as though Amateurs are "holding" frequencies that COULD be

> broadcasters clean up their own act, and lobby for their own service
> or band instead of stealing parts of other services.

Nobody's taking anything from anybody. This isn't a zero sum game, hams vs broadcasters. An amateur could broadcast and still be a good ham.

3168. BC band converter.

Source record: 161681

Did anybody ever try to modify the Kenwood TH-79 for 9600 bps FSK support? I've found the instructions (translated from German) posted in this newsgroup, but no further comments from people who actually worked this mods on their radios.

Any hint would be really appreciated.

I resisted Windows 95 at work for a while but was forced into it by the need for new 32 bit software. Now that I use it I find I have less problems overall than I did with Windows 3.1. I even have one DOS application that is a memory hog and won't run on a laptop under DOS (insufficient memory with all the PCMCIA drivers and such loaded) but it will run in a DOS window under Windows 95.

> do you sacrifice performance? Educate me, guys.

Poorly designed switching power supplies can radiate spurious emissions into your
radio receiver through several paths . The result may be lots of weird noises
scattered across the bands. A traditional analog design such as the Astron will
be very quiet by comparison. High end switching power supplies such as those made
by Lambda may also be quiet, but you're going to pay for it.
A car battery is sometimes the cheapest and best supply that you can get.

No it's not, it's 10 K bucks and jail time is virtually non-existant.
Most of the time it's a letter saying cut it out. Most do, and that's
it. On the 2nd offense, it's another letter and a visit to say "
cut it out". 3rd time's a real charmer...a letter, a visit, all
equipment taken and a court date with the Federal Magistrate, fine and
that's that. 4th time...oh boy.

>by Lambda may also be quiet, but you're going to pay for it.

It's worth noting that Astron has recently started shipping switching supplies too. They are claimed to be designed for communications use, presumably meaning they are filtered well enough to avoid interfering with radio reception.

The advantage of switching supplies is small size and weight. They typically operate the transformer that provides the voltage reduction at 30 or 40 kHz, allowing the transformer core to be much smaller than that required at 60 Hz. Filter capacitors and chokes are similarly reduced in size. In addition, voltage regulation is usually done by high-frequency switching, so little energy is wasted, not much heat is generated, and the heat sinks can be small and the supply runs cool.

The disadvantage, as noted, is that those fast switching waveforms at high current can create RFI if not carefully shielded and filtered. And the design is inherently more complex.

Dave

> do you sacrifice performance? Educate me, guys.

Switchers are lighter, smaller, usually more efficient, and sometimes cheaper.
That's the good side. They also have a bad side. They often generate excessive
RFI. They are often *prone* to RFI, IE they can come out of regulation due
to RF pickup and deliver *very* high voltage to your equipment. The former is
annoying, the latter can destroy your radio. And they are almost always a bitch
to troubleshoot if they have a problem.

Unless I need one or more of the good properties of a switcher very badly,
I prefer to stick with a brute force linear supply. It's the old, "I believe in
the lever, I believe in the inclined plane, the wheel I'm not so sure about
yet" philosophy in action. But that's probably at least a little bit irrational.
The advantages of the switcher really are fairly large, and the potential
problems can be addressed by good design.

3195. FT-51 Mods

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-17 00:00:00 UTC
From: kc5egg@ix.netcom.com
Message-ID: <64qdgd$k9g@sjx-ixn5.ix.netcom.com>
Source record: 161706

Howdy All,

Thanks for reading. I have a pair of FT-51 HTs and the ADMS software to program them. Last evening I while programing my new one(actually new to me but used) I discovered that the template for the old one will not work with the new one. Both appear to be modified for out of band transmit as indicated by my power meter/frequency counter/dummy load setup. The question is are there several mods that lead to out of band transmit so the template from one will nt work on the other? The only difference in the radios is the serial number on is 4Mxxxxx and the other is 4Nxxxxx.

If there are several mods that allow OOB transmit then I can understand the problem and then the question is how do I determine which mod has been done so I can make both radios appear the same to the ADMS software. It defeats the utility of having the same radios when the same template will not works with either. Thanks for any suggestions.

Hi all,

I want to buy a DRAKE RV-7 or RV-75 Remote VFO to complete my Drake TR-7
Station.

Must be in very good condition.

Also looking for :
DRAKE CW75 Keyer (Model 1507)
DRAKE Dynamic Desk Microphone (Model 7077)
DRAKE Theta 7000E Microprocessor Controlled CW/RTTY Decoder
DRAKE MN75 or MN7 Matching Network
DRAKE B-1000 accessory Balun for MN-75 or MN-7
DRAKE LA7 Line amplifier (Model 1230)

PLease email me with your price. I am FeDex customer and pay shipment and
duty here in Belgium.

Thank's and Best regards , 73's

They are available through Tech America, a Tandy affiliate. They are not even in the TA catalog, so you won't find them in the RS catalog either. I believe that is because they are a special purchase. So, try calling Tech America or stopping by. 1-800-877-0072. The models are Alinco DJ-S11t (2 meter) and DJ-S41t ?(440). I got my 2m for $88, and I like it. They are TINY. Also, an easy mod expands the RX to make them a tiny little scanner.

Hope I've helped.

Check your SWR. The 735, as well as most modern rigs, automatically
reduce their output power if the SWR is over 2:1. It prevents
overheating and destruction of amplifier components.

This may not be helpful, but I'd be a bit reluctant to trust the bar graph
as a reliable standard for sensitivity between units. If you can't get access
to a signal generator, find a weak steady signal, find a physical location
where receiver can be placed that just opens squelch...(be sure squelch is on
edge of threshold. Then put other rig there to compare. Signifcant
differences in sensitivity should be apparent with this test. You might also
try switching antennas, just to make sure there are no differences there.

As far as tweaking the RX, stay away from anything but the front end of the
receiver unless you have good equipment with which to do an allignment.

3207. Hallicrafters FPM-300 Safari

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-17 00:00:00 UTC
From: Pete McGreevy <PMCGREEV@MAIL.IDT.NET>
Message-ID: <3470DD1F.7EA7@MAIL.IDT.NET>
Source record: 161718

I was toddling around the hamfest this Sunday, when what do I see, an old Hallicrafters FPM-300, used to be called the Safari. Tune it up back home, and it works just fine, looks are an A+. Now, I do need one part for it, so if anyone knows where I can get some old Hallicrafters parts, please let me know.

Now, to the real point of this note... does anyone know anything about this radio? I bought it out of curiosity and to sit next to my Heathkit SB-100. Was it considered any good, junk, so-so? It has a 2.1 kc filter in it, hybrid innards, etc etc.

Any info/opinions/etc greatly appreciated.

Thanx -- Pete -- KA2YDY

Kevin --
I only know very vaguely of the radio, having seen the 202. Is it all
possible that the S-meter/RSSI/whatever RS calls it is just calibrated
differently in the two radios? A more exact measurement would be do
inject a known amount of signal into the radio and measure quieting.
Mayhap there's a pot to adjust the RSSI if the radios are equally
sensitive. I wouldn't dink with the IF without an accurate IF signal to
inject.

Kevin:

I wouldn't have much faith in the S meter. A far better indication would be the degree of noise quieting on a weak signal. If you can hear a weak repeater, or have a friend go simplex with a noisy signal, and one radio is quieter than the other under the same conditions, then one is definitely more sensitive regardless of any indicators.

Tim

Hi Mike and other readers !

I experienced bad sidetone with my TS-850 when i ran it with a cheap power supply. I got rid of the problem by switching to a (switched) power supply properly shielded, AFAIK the old power unit did'nt like some RF and was a little weak. However i still use it with annother (VHF) radio demanding less current.

Hi Gary,
Topband may be dead during daytime in the US but not here in europe.
I think as they've expanded the AM band down to 1700 for commercial
broadcasters in the US, maybe they should consider offering 1700-1800
for low power (10w) licence exempt hobby broadcasting.
How you'd expect everybody to stick to 10w, I really don't know:-)

Regards

Philip de Cadenet G4ZOW/M

Actually, many modern pirates are convinced that broadcasters (especially
the NAB) is terrified of potential competition by potential legal peanut
whistle broadcasters. Now when you look at a 50,000 watt station and
compare that to a 50 watt station, it's hard to see what the NAB is
worried about, unless it has to do with losing market share to more
innovative but smaller broadcasters. :)

If you've ever taken the time to listen to pirate freqs, you'll find that the vast majority of pirates do exercise common sense and self restraint. But I do admit that hamming seems to attract a subset who just want to spew. If the more responsible hams would crack down on these clowns (it seems that most hams just let them rampage unimpeded) then the FCC might be more open to allowing hams to broadcast. BTW, most pirates play music anyway, although there is a certain subset who want to express unorthodox political/religious views.

I had the same problem. I called. They came out promptly and fixed it
in a few days. Couldn't believe it.

3224. Sidetone problem TS-830S

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-17 00:00:00 UTC
From: badger@vbe.com
Message-ID: <346fa8d1.13227623@news.vbe.com>
Source record: 161771

I have been going crazy with a sidetone problem on my TS-830S. I seem to be picking up stray RF on send which terribly distorts the sidetone. At times even on receive the tone is also distorted although not as badly. The station is well grounded and I have been unable to locate any "floating" grounds on the boards in the rig. The transmitted signal is reportedly clean and sounds fine. The tone on transmit is as near to describe a "trilling" beat along with the tone.... at times on receive the tone sounds "chirpy". I am looking for hints on where to look next. Adjusting the side tone level has no effect. I am I suppose looking for a bad cap or choke somewhere in the circuit ? Any likely areas to look ? It has been a most annoying problem in an otherwise excellent performing rig. Could this be a voltage problem ?

Thanks and 73 Mike Melland, KB9QHU

Actually in only says that ten percent of those who accessed his page use
3.1. Current numbers show 32% (quite a lot of smaller corporate users)
are still on 3.1 even though MS has pretty much slammed support.

3229. Anyone Have Info About Transel SWR-Watt Meter?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-17 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bcf315$2d515920$098a92d0@bitnet.bit-net.com>
Source record: 161776
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I have come by a Transel model swr/watt meter. It is pretty solid,
20-200-2000w, average and peak reading.
I have the manufacturer provided half-page operating instructions sheet,
but was wondering if anyone has a schematic and parts list.
Thanks!

3232. Kenwood TH-205 repairs

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-18 00:00:00 UTC
From: rexstout@ptld.uswest.net
Message-ID: <rexstout-1811971950080001@adialup176.ptld.uswest.net>
Source record: 161531

My TH-205 is broken! I need a battery for it, the transmit button needs to be replaced(the plastic PTT button, the switch is fine), and there is no audio output. Until recently, the audio was intermittent(a good whack usually restored output), but now it is completely dead. Everything else works, but there is no audio. Where do I get the parts and send it to be repaired(cheap)?

Gag,
Unless the most hopeless of yuppie wannabes will even waste their money on a laptop, Or the Marketing people who get pampered with all the little trinkets they want but don't need.

BTW, the only programs I have seen that would totally screw up under DOS used Pharr-Lapp DOS extenders. Almost all of my DOSware and w3.1 stuff is adequate to task. The only reason I have for using 95 or NT is because I am forced into it by clients that have been suckered into using it corporately because they just had to have the latest $5,000.00 CAD package or something.

hello there,
Yes yes, it's the wrong newsgroup, but please hear me out before you start to write someting.
I'm an animation student and I am writing a paper on "adults and animation". At the moment I am trying to do some research and that's why I need your answer on these small questions.
Please e-mail me the answer because this message was posted to really a lot of newsgroups. You will find my e-mail adress at the bottom of the page.
Thank you very much for answering, and please don't even think about sending me something else than the answers, I won't take the time to read it anyway.
Brecht Cuppens

1 Which factors do you find most important in an animated movie, series, short,.....(choose three and rate, 1 being the most important, 3 the least)

1humor
2story
3visual style
4music
5Technique (3-d, cells, computer...)
6atmosphere (dark, heavy, comic, weird,....)
7dialogue
8quality of animation
9"adult content"(violence, sex, drugs,...)
10suspence
11realism
12subjects
13other (fill in)

2Which is your favourite animated movie, series, short,.....(only one please) and why?(choose from the above list)

3some personal info: age, sex , education, country

My answer would look like this:
1visual style
2storie
3humor
The Nightmare before christmas: visual style, quality of animation
20/m/university equal education(not finished yet)/Belgium

This shouldn't take too long and I kept it as short as I could,
so if you feel like it, you know what to do
thanks
Rene.Cuppens@ping.be

KPC-3 Packet modem for sale - $75 NEVER USED - STILL IN BOX.

I actually won it at a Hamfest as was wanting to sell it since I have no interest.

Write me if you are interested.

Vectronics, old or MFJ, uses the same parts suppliers so you should
expect the same problems. When independent, Vectronics assembly quality
was good; now that it is in Mississisloppy, "caveat emperator".
Unless a recent change occured the big Vectronics tuner uses the same
Delrin rotary coil as the older MFJ-989C. The March 1997 QST reviewed
that tuner as the Tucker 3000....see for yourself.

For roughly $400 one could build a top quality tuner with an all ceramic
rotary inductor, caps with ceramic, not paper, insulation, etc.
Building should not be a lost art.

That was in response to the idea that if the fuse *blows*, all vehicle current would flow through the radio. That's wrong of course. That's why there *is* a fuse.

>But the ground loop is small-signal AC with a DC offset of (almost)

Yep, that's the subtle part.

That's a good idea. If a good choke at the feedpoint doesn't solve the
problem, then you must have induced pickup. Changing the antenna
and feedline relationships is what you have to do to solve that.

That area is still filled with older cordless phones, but they aren't sold
anymore, so that should be a declining usage. That'll eventually leave
that segment vacant. Maybe you have found a new use for it. (I know
hams would rather have it as an expansion of 160m, but we aren't
filling what we've got now, so it would be hard to justify increasing
160m by 50%.)

I am interested in building or buying an effective RDF unit for use
principally in downed or otherwise active aircraft beacon location.
It would also be used for training and rabbit hunts.

Our ARES unit currently is using L-Per units owned by the local
authorities but I am sure there are probabaly more effective units
available or buildable.

Have seen literature on Russ Andrew's (K6BMG's) SuperRDF but have
never seen one.

Can anyone provide comments on units you have used? Comparisons would
be especially useful in arriving at a decision.

If you want to part with an existing unit, please let me know as
inputs received may cause me to consider buying your unused unit.

Though I'm sure others may be interested in your responses, please
send e-mail direct as I don't regularly have access to this forum.

```
FCC Enacts Internet Morse Code Requirement
--- ------ -------- ----- ---- -----------

The FCC, under pressure to clean up the Internet, especially after the
Communications Decency Act provisions regarding Internet content
regulation were stricken as violating the U.S. Constitution, has
decided instead to require a Morse code requirement for Internet
users. Citing the success of the Amateur Radio Service and the general
belief that its requirement for operators to pass a Morse code
proficiency exam and other technical requirements, has kept the A.R.S.
"clean", the FCC will enact a 5 word-per-minute requirement for all
Internet users. They are leaving open the issue of whether there
should be a "codeless" class of Internet user and are soliciting
comments on this proposal.

Persons wishing to develop a web site having only links to other web
sites having links to other web sites, and so forth, must pass a 13
word-per-minute test and demonstrate proficiency in HTML, the Internet
authoring language.

Persons wishing to develop web sites that have actual content, as
compared to just links to other web sites, must pass a 20
word-per-minute Morse proficiency test, demonstrate proficiency in
HTML and the Java programming language, and show that they have
mastery of at least one human language, such as English.

The FCC, which lacks budgetary authority to implement the testing
program, has stated that it intends to create Volunteer Examiner
programs for Internet applicants.

Dear netters,

I just bought a KW TM-7VA, and am having mixed feelings. It has absolutly great sounding RX and TX audio, and is pretty easy to use. Lots of memories, and a neat 'spectrum scope' feature. Mic lighting is great, programmable setup (PM) memory is very handy... Some of my gripes are...

Buttons not lit up on sides and bottom of control panel. Makes it hard to hit the right one in the dark.

Display hard to see in the daylight in my car. I tried all display settings, and cant get a 'comfortable' display. To me, this is very important. Display is great at nite.

Only 4 programmable buttons below screen, would like to be able to change their function (other than the 2 presets that are allowed).

Why should I have to adjust the display when I go from night time to day time? I think this is very inconvienent. It needs some sort of auto dimmer feature.

I personally would rather have a MR/VFO button, rather than two. That would free up one of the buttons on the front panel, and the mic.

CONCLUSION:
I am thinking of sending it back tomorrow, and upgrading to a Yaesu FT8100. I have an FT900, and the display is absolutely fabulous.

I would like the nets' comments. Do other owners of the KW share my feelings, or is everybody happy with the display? Does the Yaesu have some other quirk I am overlooking? One thing I would really like is remote control, the ability to change frequencies remotely, while operating cross-band repeater. Does the 8100 have that?

Thanks,
Tracy KA5ECS

We live near the mountains, and I have always heard that the
L-per units and other units using electronic switching were
pretty useless, due to the bad multipath problems.

People who search in the mountains use Yagis with attenuators.
I know that the local mountain rescue group uses that system,
but even that requires some experience and judgement, so that
a reflection doesn't send you on a wild goose chase. I have
done a fair amount with that system, and it works well,
if you have the experience.

I know that there is an active foxhunting group in Denver,
but I am not sure what equipment they use there.

With cordless phones, as with any old technology, people will junk the old
to get the new. Maybe in 40 years people will collect those old cell
phones, but it's not something we should worry about now. The idea of
setting aside 1700-1800 as a micropower broadcast band is the best I've
heard yet, and it has several advantages.

*It's right next to the existing AM broacast band-no major retooling of
general coverage recievers would be needed.

*It has local coverage.

With the Dunifer case going against the FCC, this is a great idea for
hobby broadcasting. Even Dunifer doesn't deny the FCC's right to license
broadcasters; maybe these new hobby broadcasters could be licensed as
hams, with ham callsigns, and under a revised legal code for hams. I know
that some pirates will whine about losing stereo capability with FM, but
FM is way too crowded as it is. In fact, I'll post this to

alt.radio.pirate and see what response I get there.

My suggestion is let someone else blow them up (fix it for you). I
repair them all the time and still manage to blow up a set every so
often. That circuit is VERY touchy.

Cross-posted to: comp.terminals,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I have an unused 3191 terminal sitting around, and since I hope to get my ham license soon, I decided to try to find a use for it. What I want to do is make a harware converter for ASCII<->EBCDIC that would allow me to use the 3191 as a packet terminal. It may also be necessary<sp?> to make the converter/TNC appear to be an IBM mainframe to the 3191. What I need to know is how to make the ASCII-EBCDIC converter, where to buy/how to make a cheap EPROM programmer, what TNC to use with the 3191/converter and then how to make it all work without exploding. Any ideas?

Sadly, Ham Radio is not what it could be. There are some misinformed,
some ignorant, and some truly arrogant people involved in the
"service" now who are ruining it for the majority of enthusiasts who
really enjoy radio and all it can offer.

How would you suggest we "Crack down on these clowns?" Should we go to their houses and tell them to shut up? In this day and age, that would probably be a good way to get shot.

I kind of found that the Yaesu FT900 is a clearly better
rig.

Reasons:
1) Construction is clearly more rugged. The 900 is in a
solid aluminum heat-sink chassis. Very well built.
2) The 900 has a very good built in antenna transamatch.
The Kenwood does not; it does have a pricy, and bulky,
external unit as an add-on.
3) The 900 has actual knobs and switches for most functions,
whereas the Kenwood has various layers of menus that are
hard to remember, and not nearly as handy to access.

These were my considerations when I bought my 900, which I
have been very pleased with. YMMV, hi.

>f you're using a computer to control your FT-840 HF rig,
>I'd like to hear from you. I'm interested in what software
>people are using to do the computer-control. Thanks!
>

Hi Ken, I'm not using a FT-840, but a FT-900 whcih is close enough for conversation.

I use an interface from JBI Products to take the sigs from the rig to the RS-232 port. I use Log-Eqf for my logging program and that has a primitive rig control for Yaesu's built-in. The same program has an excellent program for controlling Kenwood radios.
The rig automatically inserts the frequency and mode into the appropriate fields within the logging program so I don't have to. Another thing it does is while is while I'm tuning the bands it changes the rig to the appropriate mode for the frequency that I tune to.

Also use another program called FT-990 written by Robert E. Cartier - KD1JG for memory management. With 100 memories in the rig, manually keying them in or changing them can be tedious. It will control all the features of the the rig, but I prefer turning knobs!. ;-)

Also have a PK-232MBX in-line that does all the digital modes for me.

There are alot of other programs available that do the same things but these are what I use!

Happy hamming ..... Dwight

Drake TR-7/R-7 System For Sale. Includes:

TR-7 Transceiver with NB-7 Noise Blanker, Fan, WARC Band Capability,
500 Hz and 1.8 KHz Filters. Modified by Drake with surge
protection and other updates. Covers all ham bands 160 to 10
and has general coverage receive from 100 KHz to 30 MHz.
200 Watts Transmit Power

PS-7 Heavy duty power supply for TR-7

RV-7 Remote VFO for TR-7

SP-7 Speech Processor for TR-7 (also has phone patch and tape
recorder inputs)

Matching Drake Desk Mike(7077) for TR-7

R-7 Receiver with NB-7 Noise Blanker, 500 Hz and 1.8KHz Filters.
Also wide filter for AM. Covers from 100 KHz to 30 MHz.

Matching Speaker (Matches TR-7 and R-7)

Cables for connecting TR-7 and R-7 as system

Service Kit for TR-7 (could probably be used for R-7 also - not sure)
includes board extenders, tuning tools, etc.

Operating manuals and Service Manuals for both the TR-7 and R-7

Prefer to sell as system only. Asking $1000.00 for whole system.

Shipping and Insurance NOT included in price.

I don't know if you can get them any longer, but the ubiquitous
J-38 is probably the best handkey, particularly if you put a
pokerchip under the knob. See if Fair Radio Sales has any left -
they're located in Lima, Ohio.

Come to think of it, this is probably a "boatanchor" item with
a ridiculous price tag.

Mmmm, that was another thing my Elmer taught me - use your eyes, ears, and nose first to troubleshoot - Look for bad solder joints, arcing, connections shorting out against one another or the chassis, Listen for sounds of arcing, burning, stuck relays, certain sounds in the receiver speaker, etc., and Sniff for evidence of burnt insulation, caps, etc. (each is unique). Thanks for the reminder, Gary! Sure will be nice to have time later this Winter to play a little inside a rig again with a new local Elmer! DavidC

I have an Icom 775 DSP with both opptional CW filters and SSB filters. Serial number is 1948, and this "like new" unit has the voice synth and high stability crystal unit. I will sell this excellent radio for $2750 OBO. I also have the SP-20 and SM-20 that I will sell to the purchaser of the 775 DSP or to someone else if the entire package is not taken. My apology if you were one of the ten or so hams who responded to my original post about a month ago. My computer disk crashed, and my stored data was not recovered. Prefer local delivery near Roswell, GA, but will ship at buyers expense. I want to sell this equipment by this weekend, so email me or call 770-998-0111 between 7PM and 11 PM.

Source record: 161658

Anyone have any experience using the MFJ Super Hi-Q loop (10-30 MHz)
or the 40-15M version? I have one of the original AEA Isoloop antennas,
so
I have some experience using small transmitting loops....I am
considering
purchasing an MFJ loop, but would like some feedback from Hi-Q loop
owners first....

Also, any info on other manufacturers of small loops? My main goal is
to
get on 40 and 30 meters...since I already have the AEA loop covering
20-10...

thanks 73

Broadcasting was prohibited in the late 30's, at the same time modulated
oscillitors were ruled out on 5 meters.

Well Dave, I can tell you that the attitude is nothing new. Once
federal seizure laws started allowing law enforcement agencies to
seize property purchased with drug money, all the lawyers started
to advise their drug-dealing clients to lease, rather than buy,
that shiney new BMW.

Don't blame the FCC for hams being boring. There a many interesting
things to talkl about. most choose not to. It's there own fault.

> >
> > Hams were allowed to transmit music up until after WWII. I don't remember

Music QSO's still happen fairly regularly on the 75 meter band and
sometimes on 160. This has been going on since the early 70's. There
was a regular pirate station on 75 meters in the mid-70's, WBLO.

Many ham stations are still as well equiped as small broadcast
stations. There are at least 10 hams utilizing commercial AM broadcast
transmitters on 160 meters, on the east coast, and several others on the
west coast. The TX and and ancillary equipment is usually as good as,
or better than your typical 1kW or less, small town radio station.

> Wasn't 160m recently eaten up by the new expanded AM band?

No. The 160 meter band is 1800-2000 kHz. The expanded AM band ends at
1700.

>supply that uses a switching circuit in the regulator circuitry as a
>"switching supply". I prefer to reserve that terminology for a power
>supply of the type known as DC to DC inverters.

But you've just described most AC line powered switching power supplies. Today's switcher rectifies the AC line, usually in a voltage doubler circuit, and then chops the 300 volts (no load) coming from the doubler at a high audio rate, IE 20-30 kHz. That feeds the primary of a toroidal transformer. The secondaries of the transformer are fed to rectifiers and filters. One of the outputs is selected as a reference and is fed back to the pulse width modulator for the primary chopper to achieve the desired voltage regulation. (In a PC power supply that's +5 volts, which explains why you need to load the +5 volts output in order for the supply to operate properly.)

There are advantages to doing this. The transformer is much smaller than a 60 Hertz transformer because of the high chopper frequency, and so are the filter capacitors. The chopper doesn't have to handle a lot of current either because it is in the high voltage primary circuit. And that means it won't dissipate much power because the voltage drop across the chopper is still just the saturated device drop, which is a fraction of a volt. So efficiency is high compared to switching in the high current secondary.

The drawbacks are that you're essentially operating a "transformerless" supply in that the primary AC isn't transformer isolated from the primary rectifiers and chopper circuit. And because you're switching high voltages, you have *big* transients. And those transients are at a relatively high frequency. So you need fairly elaborate shielding and suppression to eliminate hash, and excellent insulation and isolation for electrical safety. Usually, some sort of box in a box type of construction is used to achieve these objectives.

Where you see a pure switching regulator, rather than a switching power supply, is as a secondary voltage regulator. These have an unregulated DC input and output a different DC voltage (usually lower, but if current draw is small it can be higher). No transformer is used. But there is an inductor driven by the switching circuit which acts as an energy storage device to fill in the "ripple" of the switcher. Efficiency suffers because the chopper is in the high current part of the circuit, but it is still usually better than for a linear pass transistor design. You can identify this sort of circuit by the use of an inductor and "flyback" diode rather than a toroidal transformer.

From: "Joseph R. Romanosky" <saywhat@erols.com>
Message-ID: <347189A5.923825B9@erols.com>
Source record: 161669

I have only bought two MFJ products: a Versa Tuner II and a glass mount 2/440 antenna. The Versa Tuner seems to work OK, and the VSWR measurements
seem to jive with the same reading on my other meters....I did have a problem with
the glass mount antenna; it came off when I was driving about 70 mph. However,
I believe that the rear window of my car is too concave for a good mount. I called
MFJ and they mailed me out a replacement without a hassle.

I own Kenwood, Icom, Azden, Heathkit and MFJ equipment, and can find some fault with all of them in some way....for example, I started having problems with my
kenwood HF rig on the transmit side; after trying to troubleshoot myself, I had to send
it back for repair because I couldn't get access to the PA assembly and key the transmitter at the same time...anyways, turns out that there was a cold solder joint causing the problem....

caveat emptor....

If SWR were excessive, the automatic SWR foldback circuit would act
immediately. There wouldn't be a 10 minute delay. This is most likely
being done by the APC circuit (IC15, Q74). That monitors PA current
and reduces drive if the current grows excessive.

Monitor the current draw of the radio. If it starts drifting above 20 amps
as the keydown period is extended, the APC circuit will start decreasing
drive.

The most likely cause of this malady is poor airflow to the PA. Check
the fan, and check that there is adequate clearance around the radio to
allow air to flow in and out. (Blow the accumulation of dust bunnies out
of the radio if you haven't done that recently.)

If providing adequate air circulation doesn't cure the problem, it is time
to start troubleshooting the APC circuit. C300 may have become leaky.
That would be where I'd look first if there's adequate air flow.

Hey People!!

$150 for an HF rig with power supply (assume for now it works, tubes OK)

Get on the air. This is an old rig but can put out good usable signals. Yes it will drift but so
what, turn the dial. Get 80-10m, no warc bands, no 160m. You can look inside and recognize the
parts and FIX it if you want to.

I've heard from the Swan net on 40M (?? 7284 on Sat at 2 pm est) that you can with some tube
changes and mods make this radio run 400-500 watts right out of the transceiver.

What a deal..My well trained wife nabbed one of these off the Salvation Army shelf for $10..What
luck.

Come on down to HF..

(I don't know the seller, Don who)

Steve,
Two points.
The spectrum is NOT shrinking, note the introduction of yet more bands to us amateur radio operators in recent years. Here in the UK we now have, on top of the WARC bands, 73 KHz, they are also talking about another LF band, I believe around 150 KHz. Several bands on HF where amateurs were 'secondary' users are now primary and power levels have been improved. For example most HF marine operators if not able to use VHF now have Satcom thereby freeing up HF space.
In the last couple of years we've also had out 'goodbuddy' band increased to 80 CH's.
>It isn't as though Amateurs are "holding" frequencies that COULD be
>better used by legal "broadcasters". Let the pirate and illegal
>broadcasters clean up their own act, and lobby for their own service
>or band instead of stealing parts of other services.
IMO this will be a never ending uphill battle due to the fact that the fat cat broadcasters in your country, ie, the NAB 'control' the fed's, senate et al.
Your country is nearly as UN-democratic as ours.
We still don't have a FOIA!

> >>the majority of qsl cards for CW qsos?
>
> >Because they had to resort to postcards to pass any real content?
>
> Heh. As good a jab as I've read in this group in a couple of weeks. :)

LOL. I liked that one too. :-)

But when will QSLs become electronic? A one-time key, Password protected and encrypted QSL verification! Then the QSL could be sent by any means required or available such as internet, packet, CW, or phone. A QSL bureau web site could handle the entire transaction, and the recipients could instantly verify and print if they like, or just leave it in memory at the bureau.

We would then exchange "QSL information" by simply sending a unique password serial number during the QSO.

Maybe someone's already cooked this scheme before. But it's worth heating up again.

I have a Sierra Model Z-99 Dummy Load/Wattmeter for sale or
trade. This is a commercial-industrial dummy load that operates from
50-600 Mhz, has 52 ohm terminated load. It also has a built in
wattmeter measuring up to 120 watts. This is ideal for using with
VHF and UHF transceivers. Will sell for $85 plus UPS

This dummy load/wattmeter is the style with the large
"radiator" style fins to maximize heat dissapation. This is a NICE
unit.

Potomac Electric Power Company in the Washington DC metro area also has a technician with a vehicle with appropriate equipment to chase power line noise.

I had such noise and I "knew definitely" just which pole it was coming from--except that I was wrong! That pole had a cable TV power supply which I blamed for the noise, because I had an HF direction-finding radio (used for boating purposes) which pin pointed the noise to that exact pole. After the cable TV guy came out, he said it wasn't their problem, but to please me he would plug-out the whole power supply and lug-in a new one he had on his truck. I told him if that didn't cure the problem, I wouldn't bother cable TV any more. He did and I didn't, because the problem continued. That's when I got the power company's guy out. He used my HF direction finder and found the problem. It was a faulty light control on her inside garden. She changed it and my problem went away. Now, let me tell you that the power company guy and I were permitted to go throughout my neighbor's house "direction finding" the problem. That's a situation you won't always get.

One thing I learned from the power company guy that was quite impressive about power line noise is that the power lines make beautiful antennas which can spread to noise over thousands of feet and sometimes miles. A big problem finding the offending insulator or "spark"-producer is that each pole with a ground (and most all poles have grounds) becomes a node for the noise. Therefore, an HF direction finder actually finds the node and not the problem.

HAPPY HUNTING. Hope this helps just a teeny bit.

Well, what you propose can be done, but I seriously question whether
it is worth the effort. A regular ASCII terminal can be had virtually
for the asking, and using a computer instead of a terminal has a
number of benefits. In fact I'd suggest that a better approach would
be to discard the idea of terminal and TNC altogether and simply let
a computer handle everything in software.

But if you are bound to attempt your approach, you're going to have to
do ASCII-EBCDIC and EBCDIC-ASCII as well as dealing with a terminal
intended to operate in page mode. Probably the best way to do that is
with a single chip microcontroller rather than a pure hardware
serial-parallel-code conversion-parallel-serial lashup that will still
have to somehow fool the terminal. A micro with enough spare memory
to do page mode emulation is what's needed, and that can handle the
code conversion as well. You might be able to do it with a PIC chip,
and you can certainly do it with an 8051 or a 68HC11.

You need to set yourself up to program one of these babies, and learn
its language if you don't know it already. All three companies offer
development kits for their chips which are quite reasonably priced.
I work with the 68HC11, but lots of people like the 8051, and the
PIC family has a strong following too. You need to browse the
manufacturers' web sites and see what strikes your fancy, and
make a commitment to one of them (or to some other chip, those
aren't your only choices, though they are probably the most popular).

Go tell that to the BBC, VOA, etc. They'll be surprised to learn that
their broadcasts on amateur frequencies are illegal. Hint: the
frequencies mentioned are not amateur exclusive, though amateurs
wish that they were.

I'm sorry, but I am not familiar with the 3-400 tubes. My Henry 2K-3
uses a pair of 3-500Z. I has been modified to use a Peter Dahl Power
Transformer instead of whatever was original. It is going to coast
along very nicely at 1200 w p.e.p on SSB, which is all the TL-922 can
do. The blower on it is very noisy - I can't abide having it the
same room with me.

If you are still looking and haven't bought yet, be sure to have it
demonstrated at full SSB power, and also at about 500 watts on CW.
These rigs can be a lot of trouble to fix if someone has burned them
out and not admitting it.

I wouldn't want to try for more that 300 watts out on AM, but maybe it
could do more. I think that original idea was that it would run 1000
watts input on AM, but I don't think that would be a good idea.

>I second that. All those in favor?

Let's just modify it a tad. How about we change it from codeless
to clueless? As a result, you should turn in your newsreader
immediately.

>Hey - if morse code is so bad,

Few have said it's "so bad". It just isn't the be all end all of
communications as it was 50-70 years ago.

>so tough to learn,

So is the theory, but I don't hear anyone complaining about it
because the rationale for it as a requirement is spelled out
in Part 97.

> so out dated

Well that it is.

> and so completely useless,

Again, few if anyone has said that. It's simply no more important
than any other aspect or mode in amateur radio.

> as many no coders continuously whine,

The only whining I see is from clueless folks that can't even understand
the issue isn't about Morse Code, but the requirement for
demonstrating its knowledge at higher and higher speeds to
access portions of the amateur spectrum. You might rent a
clue and check the call signs of most of those posting in favor
of change. You'll find that they have passed as many or more
Morse Code tests than your license class indicates you have.

>why do I see
>the majority of qsl cards for CW qsos? I presort cards for the W1 QSL
>bureau. Better than 75% are for CW contacts. Somebody better get a
>clue here.

Because DX chasers haven't discovered the latter half of the
20th century? No, just kidding. As an apparent wall paper chaser
yourself, you well know that it is an amusing activity to some and
many feel it is more sporting to do it the hard way. What any of
that has to do with licensing requirements is hard to imagine.
The clue you really need to rent though, is that no one cares
whether you find manual OOK Morse Code amusing and no one
is trying to prevent you from continuing to use it. The need for
Morse Code as a licensing requirement has long since disappeared.

>For those of you who will take exception to the "CW requirement" for the
>internet...Lighten up or get a life!

Why not have it as a requirement? After all, if you are going
to make arbitrary unrelated requirements for some activity, it's
about as valid as making Morse Code knowledge a requirement
to access amateur frequencies below 30 MHz.

>73 to all, even no-coders de W1AAE

73 to all, even the clueless,
Todd
N9MWB

PS This post has had its follow up line set to rec.radio.amateur.policy
as
I'm sure the other newsgroups have had their fill of this nonsense.
Please take the discussion over there.

Hello all!

30 Meters transmit for the FT-101EE

The first thing is of course to unplug the rig (G). I grin at this but
I've
been bitten a few times and this mod can bite if the rig is plugged in.
You will have to remove the entire case. IE the top, bottom and wrap case.
(I call the wrap case the case that is left after both the top and bottom
are
removed). With this rig this is pretty simple. After removing the case put
the
radio on it's back all modifications are on the bottom. (All refrences will
be
frm the rig on it's back and facing you) Then remove the cover from the
tuned
circuits. It will be the large cover on your left with a bunch of holes in
it
This will expose the tuned circuits. You will notice 3 circuit boards with
mucho trimmer capicitors and the bandswitch wafers. This is where all our
mods will be made.

From the factory the WWV position shares the 20 meter tuned circuits in
the receive end. We will be removing these jumpers and adding components
to giove 30 meters it's own tuned circuit in receive and transmit.

The first thing we need to do is get oriented. We will call the first circuit
board (nearest to you) PB-1 the next one PB-2 and the last one PB-3. Yeasu calls
then PB-1188, PB-1187A and PB-1092 respectivly. I like my names for
simplicity. Also I will be refering to the band switch wafers by letters
starting with the one nearest to you as A, the next one as B etc ending with
M. I guess this would be a good time to give you a parts list.
This is the parts list from the original article. Liberal substitutions from
your junk box is allowed, as a matter of fact my parts list just vaugely
resembles this. As long as you can get close on the capicitance you will be
OK.

T1 & 2 2 79pf Trimmers rated at 250V for PB-1 and 2
T3 1 40pf Trimmer rated at 500V for PB-3
C1 1 50pf Silver Mica cap for PB-1 rated at 250V
C2 1 68pf Silver Mica cap for PB-2 rated at 250V
C3 1 68pf Silver Mica cap for PB-3 rated at 500V

Let's get to work. The first thing is to remove the jumpers connecting the
WWV setting with 20 meters. You will need to remove the jumper on wafers C and
E.
C is no problem but E is kinda tight. I would recomend removing E at the 20
meter tab and extending the wire to our new capicitors we will be
installing.

Now we need to install our new capicitors for 10mhz. On PCB-1 the only place
I could find to put T1 and C1 was between the upper right hand cap and the
mounting screw. Install the caps in parallel with one leg at ground and the
other leg going to switch wafer C at the WWV position. Install TC2 and C2
on PB-2 as close to the left edge of the PB as possible the same way
except bring the other leg to the wire you have hanging off wafer E.
Install TC3 and C3 on PB-3 on the side closest to you between the 2 mounting
points for the cover for the tuned circuits in the same way. You will have
to run a wire from them to wafer switch G. It is kinda hard to get to and
deep but it is doable (If I can do it anybody can, I promise).

Now the fun part begins (G). For some reason Yeasu left out the tab on
Wafer l and we will need one here. I scrounged my junk box for a tab
that resembled the one they had used and found one that was close.
You will have to do the same. Cut the new tab very carefully from the old
switch with wire cutters and cut away the brad on one side. Then
Super glue the new tab in the proper position on wafer switch I. After
the glue has set attach a jumper from the tab to the 40 meter tab
(the next one to the right with the cloth cover). All we need to do

now is put a tap on the final tank circuit for our new band. Go to
wafer M. We will be putting a wire from the 30 meter position tab
to the pi tank coil. Remove the 2 inductors that are in the way and
attach a wire in-between the 20 meter and 40 meter taps. (This should
be just below the nut holding the bandswitch together). Run
this wire to the tab on wafer M. Reattach the 2 inductors.
Now drill holes in the cover in order to reach the trimmers and put
the cover back on.

Now for the aligment. The new band will have to be aligned.
Put the preselector at 4 on the dial (Not 4 O'Clock). Go to 10.000 mhz
and load it up into a dummy-load as well as you can (Remember to keep
your plate current below 200 ma).Don't be fooled by the noise at 10 on
the dial. It is a spur generated by the rig and if you load up on it it
could damage the rig. Adjust TC2 and TC3 for the highest power output.
Then turn on the calibrater and tune for a S-meter reading under 10 and
adjust TC1 for the best S-meter reading.

Now you can put the cover back on. You should have as good performance
on 30 meters as you have on any othe band.

I make no warrantys for this modification. If you mess your radio up it
is not my fault. I have done this mod and It works great on my radio.
I cannot say the same about yours. You do this at your own risk.

Next week I add 12 and 17 meters

Hello All!
Putting the FT-101EE on 17 and 12 meters

Ok folks here is the last installment of my series on adding the WARC
bands
to the Yeasu FT-101EE. The only parts you will need for this are as
follows.

1 Crystal cut for 30.520 Mhz (for 12 meters)
1 Crystal cut for 24.020 Mhz (for 17 meters)
I ordered both from International Crystal out of Oklahoma City. but there
are many sources for these.

1 DPDT 12v relays from Radio Shak
About a foot of hookup wire (22 gauge multi conductor).
A small experimenters circuit board form Radio Shack.
A good pair of wire cutters and a lot of patience. (workng room is a premium
on this mod)

Before cutting any wires I did some experimenting and found that the rig would tune up on 12 meters from the 10 meter position and tune up on 17 meters from the 15 meter position.

So how do we go about inserting 12 and 17 meters without sacrificing anything. I decide to move 28-28.8 mhz to the 10C position and use it's slot for 12 meters. Then move 28.5-29 mhz to the 10D position and use it's spot for 17 meters. Then build a switch (using the relay) to switch the 28 and 28.5 mhz crystals with the 29 and 29.5 crystals using the clarifer
switch (I like the idea of the LED and it reminds me of my old Kenwood 830).
Then replace the clarifier pot with a combination pot and pull on switch and
maybe a new LED for it. I have not completed the switch part of the mod but you
get the Idea. It will work. It is kinda involved, but this is the only way I could figure out how to do it. I'm sure someone else has done it differently.
(I thought of many different ways myself) but this is the way it worked for me.

First as in my last article have the radio on it's back and facing you with the case comepletly off. I will be reffering to the band switch (S2 in the scematic) wafers as A to M starting from the front. This is where
90% of the mod takes place.

(Note this mod assumes you have a copy of the operaters manual and scematic)

Due to Lawsuits I must make the usual disclaimer:
This mod is only garranteed to work on my radio.
I make no warranties about its usefullness on yours. If you break your radio
you own the pieces.

Locate wafer C (3rd from the front). Study it for a while and familiarize yourself as to which tab engages which bands. Isolate 10B by cutting the wires between it and the 10A tab and the 10C tab. Then using some hookup wire jumper the 10A and 10C tabs. Now due to the 15 meter tab being buried on this wafer I elected to run a wire from the 10B tab to the capicitor on the adjoing circuit board. Run a wire from the 10B tab to Capicitor TC14 (do this under the circuit board and make sure you connect to the non-ground side.)

Locate wafer E. Isolate 10B just like the wafer C. It is a major pain in the butt to do but it can be done. Connect 10B and the 15 meter tab. Now due to the fact that 10C and D are so deep I elected to run a wire from 11 meter tab to TC5 instead of trying to jumper them on this one.(Take the same precations here as above)

Locate wafer H. Jumper the 15 meter tab with the 10B tab (It has nothing attached, so this one is easy.

Locate wafer M (The final tank coil wafer). Isolate 10B as before. Jumper 10A
and 10C. Run a wire from 10B tab to the 15 meter tab(It's kinda deep but do-able).

Well that's all for this side for now. Turn the radio over. and locate the
Het crystals in the front right hand side. Remove the 10C and 10D crystals. Replace them with the 10A and 10B crystals respectively.
Put the 30.520 crystal in the 10A position and the 24.020 crystal in the 10B position. Turn the radio back over to realign the 10 and 15 meters bands.

Realign 10 and 15 meters per the users manual. Put the case back on.

That's it! Except for the loss of 29MHZ. I plan to build a switch using the
relay to switch the 28 and 29 mhz crystals. Should be easy as one leg is grounded so all you need to switch is 1 leg per crystal. As I stated before I plan to use the clarifer switch and replace it with a pot with a pull-on switch. With some nice rub on numbers you could make it look factory.
(BTW Does anybody know of a good source for these in white? All I can find around here are black)

I am in the proccess of making many more mods to this radio to bring it onto the 90's. I can't help it. I'm a tinkerer. I'd rather work on my rig than
use it (Grin). I will be posting them as I get them completed.

YES RIGHT YOU ARE G-Ray!!

Aye SWL the ham bands and it be real Circus of Indius complete with
critchety old 2-faced farts, cheap assed bastards who try to jew down on a
25 cent price item at a hamfest and many sexual perverts than
in the redlite district of town. Greatest collection of geek mental
patients in any place. I went to a few ham fests with CB friends from the
Raleigh-Durham NC area, never seen bigger collection of nut cases wearing
clothes looking like they have not been washed in ten Years. My faves were
the ham goofballs wearing old army and cammo type clothing with 4 or more
walkietalkies on their beer gut streech'd belts. They look and act like
they were ready to go to a McDonalds or a Lubys after the hamfest with an
assault weapon or back to work at Post Office the next day. Scary!
Be afraid as most hams seem to not be wrapped too tite in the head.

Anyway here are some frequencies where you can hear ham radio ops in their
natural enviornmental, using dirty language on a DAILY 24 HOUR
shift work. These nuts really must not need sleep, I hear them comedy all
time on my old R-1000 Kenwood which sits next to my Uniden 2510 and
Sommerkamp CB radio - Leon N.C. "Hoppy Leo"

6am all day long, till sundown --> 14.300 to 14.313 USB
After sundown or starting 8pm to midnite --> 3.894.5 & 3.901 & 3.950 LSB
Midnite to 6am --> 3.853 or sometimes 3.950 continued LSB

24 Hours a day -- 7 days a week all manner of nutcase and mentaly
derranged ham op's on the above freq's and also check 3.850 LSB
late nite when 3.853 is quiet not too often.

There are WEB PAGES put up by hams with more info on crazy
places on ham radio bands. Here are a few to go see sometime:

I would think that ham rigs are designed for a particular operation cycle
(i.e. transmit for x seconds, receive for y seconds, standby for z seconds.)

If you constantly transmit for an hour you're likely to fry the rig.

Looking for a high quality mobile antenna that permits you to operate
from
10 - 80 meters without a tuner or getting out of your vehicle to QSY?

They are built on a made-to-order, ham to ham basis, custom made to your

suit your requirements. They're built to endure the extremes of
operating
conditions typically found in the winters and off-the-road conditions
here
in the upper midwest.

Top quality, guaranteed, competitively priced and typically available in
a
week.

Specs and color pix available in two forms: One, e-mail me for a zipped

Microsoft Word doc with jpegs file attached to e-mail or Two, e-mail me
for
snail mail including your name and address.

3359. TS-450s Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-19 00:00:00 UTC
From: N4LRA <n4lra@xjuno.com>
Message-ID: <01bcf539$859affc0$56023095@PBSSOC1.pbs.org>
Source record: 161496

I am experiencing a problem with transmit tuning on 20 meters with my
TS-450S.

The symptoms are erratic SWR indications and fluctuating output power to
the antenna. I can connect the antenna to my ICOM 735, and TS-520 and show
an SWR of 1.5 or less on 20 meters.

I do not use the built in antenna tuner, but when using an external tuner,
have a great deal of difficulty getting this rig to tune on 20. This is the
only band where I have
the problem. All other bands work normally.

Does anyone have experience with this type of problem?

I would really like to fix this.

Actually, it is a "BIG DEAL!!!", Steve. If every nullwit with something to peddle sent you 12 email messages hawking their wares, you'd quickly find your electronic mail service rendered useless for all practical purposes. Theft of computing resources via unsolicited bulk email is no laughing matter.

Unless, of course, you have some connection with the below-mentioned spammers, hence the unnecessarily-belligerent and defensive attitude?

3374. FTdx2000 - need help

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-19 00:00:00 UTC
From: Ron <hegerREMOVE@erols.com>
Message-ID: <34730338.200F@erols.com>
Source record: 161511

I bought a used Yeasu FTdx2000 linear amplifier which loads up to full power into a 50 ohm dummy load on all bands except 80 and 40 meters. On these two bands I get a dip in plate current indicating that the circuit is tuned properly. However, the output tuning capacitor becomes fully meshed before I get full rated power on the two bands. It should load up to 1200 watts CW but I can only get about 600-700 Watts on these two bands as indicated by plate current when the transmitter is keyed. I tried adding external capacitance in parallel to the load capacitor, but still could not get full power. The power supply is putting out full voltage. The amp uses four 6KD6 tubes in parallel. I tried four different tubes and that does not solve the problem. Does anyone have an idea why this is happening? Is this normal for this amp?

>operating illegaly.

Your absolutly right and for anyone that thinks that broadcasting is the
way to go just go listen to the broadcasts made by K1MAN everyday
on 14275khz. Many of us have been trying to get this guy off the air
for years but the FCC and the ARRL don't seem willing to do anything about
him. He fires up his broadcasts (which are tapes) right over other
conversations and when we have had the chance to chat with him live
he says it's is "given right".

As a non american the situation with this guy has been very
frustrating
to say the least, dealing with the FCC and ARRL is almost a waste of time,
it's time for american hams to start policing there own and get ride of guys
like K1MAN who broadcast. The same goes of the live broadcasts of the
space shuttle on the ham bands and any other broadcasting that goes
on by anyone in any country. If people want to broadcast, get a broadcast
licence and go send to your hearts content in the broadcast bands as laid

down by international treaty! Get off the ham bands!

I'm sure I'll take flak for my comments but for anyone who disagrees
go
and have a conversation about it on 14275 khz and you'll see what I mean
when the broadcast fires up and wipes out your conversation. Do you want
this happening on all frequencies all day long? Think about it.

The Kenwood TM-V7A is remotely controllable, althought it isn't mentioned in the manual. Get the two-page Application Note at ftp://ftp.kenwood.net/d%3A/kenwood/Amateur/AmateurApplicationNotes/ -- from the index page:

TM-V7A AAN-0020 TM-V7A External Remote Control Operation

I haven't tried it yet, and in fact just bought a 440 HT specifically for this purpose.

Since I have been a happy user of ADI products, and have had numerous productive email interactions with Ken Collier, KO6UX, whose name appeared in N1IST's article, I followed up to Mike's post by mailing to Ken and letting him know that I hoped that ADI would stop this behavior. Here is Ken's response, reposted with his permission.

Thanks for the e-mail and the concern. We did indeed send out a -very- small number of unsolicited e-mails promoting our website.

However, in light of the very strong reaction of a number of folks who received the e-mail, we have indeed discontinued the practice of sending unsolicited e-mail, effective immediately. We apologize to everyone who was offended by our use of the Internet in this manner.

For the record, I find it very unlikely that the gentleman whose usenet post you saw received 12 e-mails, as he claimed, unless he has 12 different e-mail addresses that are all forwarded to the same account, or unless some error occured at the server which duplicated the message. We certainly did not send 12 messages to the same address.

Further, I don't believe we told him that direct e-mail marketing was "acceptable" when he called, but rather that it was "an accepted practice," meaning that many other companies had adopted its use. Whether it is "acceptable" is entirely a matter of debate, one that whole newsgroups are devoted to. We make no judgements about whether it is "acceptable" or not.

The practice is definetly growing in popularity, and is here to stay. Even though we, at ADI, have chosen not to use this method of marketing, other companies certainly will. In hindsight, our use of direct e-mail marketing was obviously a mistake on our part, and we have no intention of repeating it.

>Philip de Cadenet

>G4ZOW/M

Spectrum can apparently shrink in many ways... you can lose
frequencies, have to share them with other services OR you can pack
more people on the same frequencies. If you allow Amateurs to
broadcast, that is CERTAINLY another form of spectrum shrinkage as it
also removes usable spectrum from the shared pool.

The discussion's title was HF, so I didn't count LF (which most
Amateur gear can't do anyway... which was the OTHER point in the
title).

Regardless of whether U.S. or worldwide, Amateur Radio is supposed to
be a legal and licensed endeavour. Pirate or illegal broadcasters are
not, and simply take what they want with no regard to commonly held
standards of behavior. It is simply an attempt at anarchy. If they
want it so bad, let them BUY spectrum like everyone else! <insert
biggest tongue-in-cheek grin here>

Yes, the U.S. Government can be purchased at the right price... what else is new (we learned it from all the other corrupt and oppressive countries around the world that our citizenry is made up of). It just took us a bit longer to get there and it is much bigger is scope (so it is a bigger target of discussion).

IMHO

Steve

I recently purchased a Radio Shack HTX-242 2m mobile and my modulation
is rather low. Is there an easy way to adjust the audio output.

Any info would be greatly appreciated.

Hallicrafter had already been sold and the bones picked by the time the
FPM-300 appeared. I think it may well be the last piece of electronics to have
the Hallicrafter name glued on it.
What kind of parts do you need for this A+ rig?

Hello Mike,

I can't find it on the picture at 13-2 Bottom View, but I do see it on the schematic. It's in the base circuit if Transistor Q72 and Q72 is electrically between IC 18 and IC 19. It seems to be on the Main Board itself - not in one of the sub-assemblies that might be on the main board.

So, if you can find any of those components, it's bound to be very close. BTW its shown as a 4.7K pot and connects D152, R383,C292,R376, & R375

How did you get a license without knowing this?! Go read your rule book or study guide! Broadcasting to the general public is ILLEGAL on frequencies reserved for Amateur Radio! I wouldn't post your call sign if I were you (if it it really is yours) as you certified that you know all the rules and regulations when you apply and receive your Ham license. The FCC could investigate if you are who you say you are, and take your license away from you for making the statement you did, as it shows that you do not know the rules and regulations and could be operating illegaly.

I second that. All those in favor?

Hey - if morse code is so bad, so tough to learn, so out dated and so completely useless, as many no coders continuously whine, why do I see the majority of qsl cards for CW qsos? I presort cards for the W1 QSL bureau. Better than 75% are for CW contacts. Somebody better get a clue here.

For those of you who will take exception to the "CW requirement" for the internet...Lighten up or get a life!

3430. F.S. UHF Duplexer, USED $100

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-19 00:00:00 UTC
From: looking@forhelp.com
Message-ID: <3472559f.8528600@news.dxnet.com>
Source record: 161570

I have a NEW UHF Duplexer for sale. Manufactured by Cellwave. This unit is USED, and covers the entire 440 to 475 Mhz with no problem. It was originally made for UHF 440-470 repeater and mobile use and is the '6-Pack style Duplexer. It is rated for 70 Watts max., constant duty.

Price is $100 Including shipping, Priority US Mail and Insurance. Contact: 5doc@dxnet.com but BE SURE REMOVE THE '5' in the address given here... the 5 is in there to send Spammers elsewhere.

Please contact me by EMail and NOT herre on the NewsGroup. Thanks
Doc

> tone frequency.... could someone shed some light on this for me?

(Doing this from memory, hope it's right)
Remove the power amp (or battery pack) from the rear of the radio.
Looking at the back of the radio you'll see a rectangular plate held on
with a screw (or 2). Remove the plate and you'll find a circuit board
with DIP switches for setting the PL... OR... you'll find a cable with a
connector, which means the PL board isn't installed. Good Luck.

Perhaps you would share with us some of your specific pros and cons
relative to OS/2 and Windows.

I've tried OS/2 in two of its versions - I believe my first was
ver2.0, and then I tried the Warp version. I never had as much
trouble with any Microsoft product. My woes were:
Inadequate driver support for CD-ROMs
Sound Blaster problems with DOS Games, such as Doom
Windows Apps ran slower in the OS/2 environment
Crashes were just as frequent as in anything else.

On the other hand, I would say that IBM was setting the pace on Object
Oriented Interface, and I think the Windows 95 desktop was a copy of
OS/2.

>Hey - if morse code is so bad,

It's not bad, it just has no compelling reason to
continue to be a license requirement.

>so tough to learn,

The degree of difficulty is not the issue at all.

>so out dated

It is certainly out dated as it's use has now down to only
a recreational aspect (QSOs, DX, contests, etc.) within the
ham ranks only. Even in the ham ranks it serves no
purpose at all in emergency preparedness and or any
actual safety or distress operations.

and so
>completely useless,

It isn't useless (procode red herring again) it has its
proponents and users, but none of the uses suffice any
longer to mandate the separate pass/fail test element that
code contines to have. Yes, there's a treaty requirement
today, but that is met completely by a 5wpm test for
now and there's no additional treaty elements that
require 13 or 20wpm testing.

>as many no coders continuously whine,

Again, many (most?) of us that are championing
the end of code testing are NOT nocoders, but rather
coded hams who have already passed various levels of
code testing.

>why do I see
>the majority of qsl cards for CW qsos? I presort cards for the W1 QSL
>bureau. Better than 75% are for CW contacts. Somebody better get a
>clue here.

What's the point? QSL cards are just the exchange of record for
a contact. It isn't the USE of CW that we oppose, it is the
mandated test requirement that is wrong for the license
testing today. If, as you note, most QSL exchanging is for
CW contacts then I see no reason to think

that continued use of CW will end IF code testing
ends. Indeed, if DX continues to be the interest area
it always has been, then there will continue to be new
devotees to CW for that reason alone. Having said that,
I'll repeat again that DXing is not a reason that justifies
mandated CW testing today.

Exactly - LPers work just fine - there's a good reason that they're the
standard for locating ELTs. They work, and they're cheaper than some
of the competition such as "The Tracker." Multipath can almost always
be resolved even in "DF" mode by looking at the S-meter; the signal
with the strongest reading is the "real" one. The "recieve" mode is great
for tracking horizontally-polarized signals, too.

3445. Question re: NiMH batteries

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-20 00:00:00 UTC
From: dddavis@atl.mindspring.com
Message-ID: <6508d7$b0n@camel12.mindspring.com>
Source record: 161386

I purchased a NiMH battery pack for my FT-50 from Mr. NiCAD at a recent hamfest. This pack has a nomibnal 7.2V output in the same form factor as the FNB-40 NiCAD pack, which puts out 6.0V. I guess they figured out a way to squeeze an extra cell in the NiMH version.

I noticed that the NiMH pack seems to drop in voltage when transmitting more severely than the NiCAD pack. The voltage isabout 1 volt, versus a couple of tenths on the NiCAD pack. Of course, this negates part of the advantage of the higher voltage. I am wondering if the NiMH cells have a higher internal resistance than NiCAD's, or if Mr. NiCAD didn't do a good job of keeping the interconnect resistance low.

I would appreciate feedback from other users of NiMH packs, especially the 7.2 volt version from Mr. NiCAD, MAHA, or any of the other vendors.

regards, Don (KE4KYO)

The same as K1MAN, who is sending bulletins that are perfectly legal.

SOme whiners tried to attack him and get him off the air about three
years ago, and they were vocal, including nasty remarks on the
internet, things like petitions, threats, maybe lawsuits, I don't
remember. In any event, they failed miserably.

A lot of people enjoy the W1AW and K1MAN bulletin transmissions!

There is already a "code requirement" for the internet.
Every user has to learn how to type. This weeds out those with no
hand-eye coordination or touch-insensitive persons...
The skill of touch-typing is very similar to the Morse skill.

In fact, my maximum CW speed and typing speed at one time were almost
exactly the same (topping out at about 45WPM). I had a "mental block" at
that speed for some reason. Through practice I increased my typing speed
to about 60WPM. Internet chat groups on the low end of the #channels
(where all the DXers work) was the fix.

Wel Tracy, I have one of these radios. I must admit I don't get too
concerned with all the bells and whistles, my hf rig has all of those.
When I am mobile I talk on a few repeaters and that's about it. I did
want to say that I have the display mounted on the steering column and

have no problem reading it day or night. I don not have it on the full brilliance setting, seems to me it is somewhere in the middle. Sorry to hear you are disappointed with your radio, but just because I like it doesn't mean you have to. Hope you find the rig you want.
Gary K5XZ

I doubt if the US government (a la FCC) will ever legalize what is now illegal unlicensed broadcasting. In case you have not heard, on Nov. 19 the government in the form of "heavilly armed" DoJ agents, Customs Agents and FCC Engineers raifded three Tampa Fl. pirate stations; carted away every bit of electronics in sight -- including the guy wire holding up antennas; and also carted one pirate broadcaster off to jail to face a 14 count citation. He could serve 2 years in jail and be fined a half million dollars.

And the words "heavilly armed" come from several news reporters -- TV and print -- that went along on the pre-dawn raids.

This, coupled with raids last month in Miami, West Palm Beach and Kansas City -- and 2 months ago in Sacramento Ca. seem to indicate a trend. One saying that the government -- all agencies in any way involved in interstate commerce (broadcasting is considered as commerce) -- are geered up for an all-out war to obliterate all unlicensed broadcasting.

How much you want to bet that we will see a lot more raids like this in coming weeks and months.

From: jdonimi@aol.com
Message-ID: <19971120084501.DAA06480@ladder02.news.aol.com>
Source record: 161401

I notice that Icom offers 3 CW crystal filters for the IC-706.

FL-100 500 Hz $99
FL-101 250 Hz $99
FL-232 350 Hz $90

The 350 Hz bandwidth may be just perfect for persons like me that believe that 250 is too narrow, but 500 is too wide.

Only thing - why is the 350 Hz filter cheaper? Do you get less of a filter (filter skirts, lower ultimate attenuation) with the 350 Hz model?

I called Icom recently, but - luck of the draw - I got a tech rep who didn't know anything about crystal filters. Usually Icom employees are great to work with, but not this time.

Anyone know the answer? Anyone use the 350 Hz filter?

Jeff,
I'm glad someone finally got around to answering your origional question. It's getting pretty deep around here, so I guess you have enough sense (or have learned from this group) to stay away from the ham bands!
You will most likely have to provide additional cooling, or run the rig well below it's rated power limit as the above poster implies. They are made for mostly voice, SSB transmissions and would croak pretty quick if used in AM mode continous duty. If you are intending to use SSB the same applies if broadcasting music or continous modulated audio. If you are planning on using high power, there are quite a number of table-top amplifiers that would stand up to 400 to 500 watts output of AM signal and be happy running this way 24 hours a day, 7 days a week.
I must also say that all of this is illegal if done inside the United States or its posessions, so you must be prepared to be well outside the territorial limits of not only the states, but the rest of the countries that are members of the I.T.U.

Good Luck,
Steve

I have a Sommer XP507 antenna for sale. It is in perfect shape, about 4 years old that I am needing to get rid of. It is assembled and laying on some saw horses in my back yard and can be checked with a meter for operation if you like. It works 10-12-15-15-20-30-40 meter bands, 15 foot boom, 7 elements, and about 75 pounds.
I WILL not ship this antenna so if you are interested and live close enough, email me. I am asking $275.00 or best offer.

Hello all!

30 Meters transmit for the FT-101EE

The first thing is of course to unplug the rig (G). I grin at this but
I've
been bitten a few times and this mod can bite if the rig is plugged in.
You will have to remove the entire case. IE the top, bottom and wrap case.
(I call the wrap case the case that is left after both the top and bottom
are
removed). With this rig this is pretty simple. After removing the case put
the
radio on it's back all modifications are on the bottom. (All refrences will
be
frm the rig on it's back and facing you) Then remove the cover from the
tuned
circuits. It will be the large cover on your left with a bunch of holes in
it
This will expose the tuned circuits. You will notice 3 circuit boards with
mucho trimmer capicitors and the bandswitch wafers. This is where all our
mods will be made.

From the factory the WWV position shares the 20 meter tuned circuits in
the receive end. We will be removing these jumpers and adding components
to giove 30 meters it's own tuned circuit in receive and transmit.

The first thing we need to do is get oriented. We will call the first circuit
board (nearest to you) PB-1 the next one PB-2 and the last one PB-3. Yeasu calls
then PB-1188, PB-1187A and PB-1092 respectivly. I like my names for
simplicity. Also I will be refering to the band switch wafers by letters
starting with the one nearest to you as A, the next one as B etc ending with
M. I guess this would be a good time to give you a parts list.
This is the parts list from the original article. Liberal substitutions from
your junk box is allowed, as a matter of fact my parts list just vaugely
resembles this. As long as you can get close on the capicitance you will be
OK.

T1 & 2 2 79pf Trimmers rated at 250V for PB-1 and 2
T3 1 40pf Trimmer rated at 500V for PB-3
C1 1 50pf Silver Mica cap for PB-1 rated at 250V
C2 1 68pf Silver Mica cap for PB-2 rated at 250V
C3 1 68pf Silver Mica cap for PB-3 rated at 500V

Let's get to work. The first thing is to remove the jumpers connecting the
WWV setting with 20 meters. You will need to remove the jumper on wafers C and
E.
C is no problem but E is kinda tight. I would recomend removing E at the 20
meter tab and extending the wire to our new capicitors we will be
installing.

Now we need to install our new capicitors for 10mhz. On PCB-1 the only place
I could find to put T1 and C1 was between the upper right hand cap and the
mounting screw. Install the caps in parallel with one leg at ground and the
other leg going to switch wafer C at the WWV position. Install TC2 and C2
on PB-2 as close to the left edge of the PB as possible the same way
except bring the other leg to the wire you have hanging off wafer E.
Install TC3 and C3 on PB-3 on the side closest to you between the 2 mounting
points for the cover for the tuned circuits in the same way. You will have
to run a wire from them to wafer switch G. It is kinda hard to get to and
deep but it is doable (If I can do it anybody can, I promise).

Now the fun part begins (G). For some reason Yeasu left out the tab on
Wafer l and we will need one here. I scrounged my junk box for a tab
that resembled the one they had used and found one that was close.
You will have to do the same. Cut the new tab very carefully from the old
switch with wire cutters and cut away the brad on one side. Then
Super glue the new tab in the proper position on wafer switch I. After
the glue has set attach a jumper from the tab to the 40 meter tab
(the next one to the right with the cloth cover). All we need to do

now is put a tap on the final tank circuit for our new band. Go to
wafer M. We will be putting a wire from the 30 meter position tab
to the pi tank coil. Remove the 2 inductors that are in the way and
attach a wire in-between the 20 meter and 40 meter taps. (This should
be just below the nut holding the bandswitch together). Run
this wire to the tab on wafer M. Reattach the 2 inductors.
Now drill holes in the cover in order to reach the trimmers and put
the cover back on.

Now for the aligment. The new band will have to be aligned.
Put the preselector at 4 on the dial (Not 4 O'Clock). Go to 10.000 mhz
and load it up into a dummy-load as well as you can (Remember to keep
your plate current below 200 ma).Don't be fooled by the noise at 10 on
the dial. It is a spur generated by the rig and if you load up on it it
could damage the rig. Adjust TC2 and TC3 for the highest power output.
Then turn on the calibrater and tune for a S-meter reading under 10 and
adjust TC1 for the best S-meter reading.

Now you can put the cover back on. You should have as good performance
on 30 meters as you have on any othe band.

I make no warrantys for this modification. If you mess your radio up it
is not my fault. I have done this mod and It works great on my radio.
I cannot say the same about yours. You do this at your own risk.

Next week I add 12 and 17 meters

Hello All!
Putting the FT-101EE on 17 and 12 meters

Ok folks here is the last installment of my series on adding the WARC
bands
to the Yeasu FT-101EE. The only parts you will need for this are as
follows.

1 Crystal cut for 30.520 Mhz (for 12 meters)
1 Crystal cut for 24.020 Mhz (for 17 meters)
I ordered both from International Crystal out of Oklahoma City. but there
are many sources for these.

1 DPDT 12v relays from Radio Shak
About a foot of hookup wire (22 gauge multi conductor).
A small experimenters circuit board form Radio Shack.
A good pair of wire cutters and a lot of patience. (workng room is a premium
on this mod)

Before cutting any wires I did some experimenting and found that the rig would tune up on 12 meters from the 10 meter position and tune up on 17 meters from the 15 meter position.

So how do we go about inserting 12 and 17 meters without sacrificing anything. I decide to move 28-28.8 mhz to the 10C position and use it's slot for 12 meters. Then move 28.5-29 mhz to the 10D position and use it's spot for 17 meters. Then build a switch (using the relay) to switch the 28 and 28.5 mhz crystals with the 29 and 29.5 crystals using the clarifer
switch (I like the idea of the LED and it reminds me of my old Kenwood 830).
Then replace the clarifier pot with a combination pot and pull on switch and
maybe a new LED for it. I have not completed the switch part of the mod but you
get the Idea. It will work. It is kinda involved, but this is the only way I could figure out how to do it. I'm sure someone else has done it differently.
(I thought of many different ways myself) but this is the way it worked for me.

First as in my last article have the radio on it's back and facing you with the case comepletly off. I will be reffering to the band switch (S2 in the scematic) wafers as A to M starting from the front. This is where
90% of the mod takes place.

(Note this mod assumes you have a copy of the operaters manual and scematic)

Due to Lawsuits I must make the usual disclaimer:
This mod is only garranteed to work on my radio.
I make no warranties about its usefullness on yours. If you break your radio
you own the pieces.

Locate wafer C (3rd from the front). Study it for a while and familiarize yourself as to which tab engages which bands. Isolate 10B by cutting the wires between it and the 10A tab and the 10C tab. Then using some hookup wire jumper the 10A and 10C tabs. Now due to the 15 meter tab being buried on this wafer I elected to run a wire from the 10B tab to the capicitor on the adjoing circuit board. Run a wire from the 10B tab to Capicitor TC14 (do this under the circuit board and make sure you connect to the non-ground side.)

Locate wafer E. Isolate 10B just like the wafer C. It is a major pain in the butt to do but it can be done. Connect 10B and the 15 meter tab. Now due to the fact that 10C and D are so deep I elected to run a wire from 11 meter tab to TC5 instead of trying to jumper them on this one.(Take the same precations here as above)

Locate wafer H. Jumper the 15 meter tab with the 10B tab (It has nothing attached, so this one is easy.

Locate wafer M (The final tank coil wafer). Isolate 10B as before. Jumper 10A
and 10C. Run a wire from 10B tab to the 15 meter tab(It's kinda deep but do-able).

Well that's all for this side for now. Turn the radio over. and locate the
Het crystals in the front right hand side. Remove the 10C and 10D crystals. Replace them with the 10A and 10B crystals respectively.
Put the 30.520 crystal in the 10A position and the 24.020 crystal in the 10B position. Turn the radio back over to realign the 10 and 15 meters bands.

Realign 10 and 15 meters per the users manual. Put the case back on.

That's it! Except for the loss of 29MHZ. I plan to build a switch using the
relay to switch the 28 and 29 mhz crystals. Should be easy as one leg is grounded so all you need to switch is 1 leg per crystal. As I stated before I plan to use the clarifer switch and replace it with a pot with a pull-on switch. With some nice rub on numbers you could make it look factory.
(BTW Does anybody know of a good source for these in white? All I can find around here are black)

I am in the proccess of making many more mods to this radio to bring it onto the 90's. I can't help it. I'm a tinkerer. I'd rather work on my rig than
use it (Grin). I will be posting them as I get them completed.

Hello Bill,

I am surprised. I assumed that this problem was something wrong at my
shack.

I have always experienced these same sort of problems only on 20M with
my TS-450SAT. Since I also have an ICOM-751A that I can put into the
exact same situation with no such problems, I attribute these symptoms
to an idiosyncracy of the TS-450.

My problems have not been as severe as yours. I have found that
removing all grounds from everything in the shack and letting the only
ground in the system be the earthing of the coax as it passes through
a coax switch on its way through the outer wall tends to minimize the
problem.

Now that I've heard of someone else having the problem, I will try to
see if I can do some more work on it. Let me know how you make out
after removing all grounds.

From: jrhodes@iti2.net
Message-ID: <3473adfe.45792093@news.zippo.com>
Source record: 161452

What is the procedure for tuning a 5 element 2-meter beam?

The antenna currently has the lowest SWR at a frequency lower than desired. Should I shorten only the driven element and check for lowest SWR? What should I do about the directors?

I just looking for general yagi antenna tuning instructions. If it's in the latest ARRL Antenna book, I've missed it. Thanks.

Hello,
I am looking for an inexpensive 440HT. That is capable of transmitting
440-449. And receiving to at least the 470MHz range. Also like it to have

CTCSS encode and decode if possiable but encode is more important to me.

If the unit is a dual bander 2m/440 I would maybe buy it if its in the
budge
range.

I want a name brand - Yaesu - Icom - Alinco - Standard - or Kenwood

Looking to spending the most $150-190

Thanks for your time... if you have anything please let me
know.

W1AW does not broadcast to the general public (which is illegal on the
ham bands) they are sending a one way message of Ham interests to other
Ham operators.

Dear Reader:

I've done a little surfing and found some archives of mailing list
but was unable to find how to subscribe.

I want to get a reciever in the $100 to $300 dollar range to use as
an introduction to SW listening for the family. It will probably go into
the kids room. I want this to be a good reciever so that they have
the best chance at a good expierience. It will need to be turn-key
refurbished, but not cosmetic, that would be a waste. I will probably be
on an attic loop antenna.

Thank you.

Like new SB-230 amp for sale. This amp uses a single 8873 tube and will run 1200 Watts. It is ideal for the new solid state radios in that the input is tuned very well to match the SB-104 tranceiver which is solid state. It is extremely well protected against high swr, overheat, etc, and has a standby switch. Is convection cooled so it is silent. Will sell for $425 as I just don't need it. thanks

So yes there are places on the dial where "you" and probobly I too don't think too much of the people who talk there. So that means that the whole lot of amateurs are freaks. Is that what you meant? How intelligent.

How about all the computer operators here on the internet who cuss each other in writing, and complain about a hobby that a lot of them are too lazy to spend the effort to get a license for?

Wake up buddy, the entire world is full of crazy idiots. Ham radio has no higher percentage than anywhere else.

So is K1MAN. And BTW, broadcasting to the public is illegal for hams to
do, but it isn't illegal on the "ham bands", as the numerous SW broadcast
stations on 40m clearly demonstrate.

Yes. Price everything through AES and you'll see just what kind of a deal
this is.

I am looking for page 4 of the documentation for Lee Martin's (KD4YBC) 5 Pole Chebyshev Filter Kit for one of his R.F. Electronics HF amplifiers. I understand that he now offers a 7 Pole kit and no longer has any trace of his old 5 Pole docs. If anyone has that page that can be copied, please let me know!

Tnx and 73!

Greetings!

Maybe someone here could help me/shed some light on the subject. This is what i'm looking to do..

The security company I work for is looking at setting up an MDT Network. At first, we'd just like the units to talk back & forth for communications that can't be passed on voice channels, then in a few months we'd like to expand it to add database capability for our contacts, etc.

We have Motorola 9100-20 MDT's installed in the vehicles currently (4 of them we have total). Our question is, whats a cheep/inexpensive way to get these things to communicate with each other? We need probably 15-20 mi's of range. Does anyone know of any inexpensive services in the Chicagoland area that may be of assistance, or if anyone can shed *ANY* light on this subject...please email me at gkaiser@starnetinc.com

Thanks!
Greg Kaiser

Already people on alt.radio.pirate and the FRN Grapevine (http://www.frn.net/grapevine/) are talking about blowing up yourself and your station to avoid FCC raids, killing agents, etc. Not only that, some

militia types are talking about defending free radio broadcasters. The govt may soon have a real guerrilla war on its hands. And I know I'll be flamed, but even though I'm dedicated to nonviolence, I may have to go out and fight alongside the free radio people and the militia. I simply can't stand by and let our arrogant govt run roughshod over the rights not only of US citizens but of the whole world. The US government has a comeuppance coming, and it won't be pretty.

3499. Save up to 75%

How would you like to save 50% to 75% on virtually everything you are currently buying? This includes...

Computers and Supplies
Office Equipment and Supplies
Audio and Video Equipment/Car Stereos
Musical Instruments
Home Appliances/Furnishings
Sporting Goods and Recreational Equipment
Arts/Crafts/Collectables
Sewing Supplies
Tools/Hardware
Cameras/Photo Equipment
Music CDs/Cassettes
Garden/Farm Supplies and Equipment
Pet Supplies
Clothing/Shoes/Jewelry, etc.
Snowmobiles
Motorcycles and Parts
Groceries/Medicines/Toiletries/Personal items, etc.
Airline Tickets/Travel/Hotels
Health Insurance
Automotive/Boating, etc.
And Much More!

You really can save up to 75% on all of these and more!

I have some of the same feelings about mine. I'm not very pleased w/ the intermod rejection either. I don't agree w/ you about the audio being great though...external speakers are almost a must. I use my mobile hard and have found the V7A very useful in most cases, but a priority would be very helpful for those of us in public safety.

As a reporter, I think I would be questioning the need for "heavily armed"
anything when arresting someone for what is, effectively, a white-collar
crime. Did the FCC and "legal authority" think these "pirates" had
fully-automatic assault transmitters?

Your wrong on the encode decode thing...

The radio is setup different then most rigs, there is a ctcss
(encode/decode) function and a tone (encode only) function.
By choosing the "Tone" button you put the radio in encode only. When
you choose "CTCSS" the radio encodes and decodes the freq. you have
choosen.

Pretty simple.... Just different..

I think you are probably right. And as I have no sympathy for pirates, I'm
tempted to cheer. What restrains me from that is the paramilitary tactics
that government agents have adopted against US citizens not charged
with violent felonies. That is very disturbing and provocative. The
government has chosen to escalate matters to the status of making war
on its citizens, and that is very likely to provoke a war-like response.
(And in fact it has, witness the assault on Mt. Carmel and the response
in Oklahoma City.) The government is inviting guerrilla war with its
tactics, and it is plain that there are those out there willing to respond
to that invitation. Whatever happened to the FCC field agents in suits
who used to politely knock at the front door? I suppose that they are
casualties of the War on (some) Drugs which started this trend of
using paramilitary assualts against non-violent American citizens.

Gary:

As one who has done so, I hope that everyone who is concerned is out there helping to elect people who reject this methodology - and that they themselves VOTE! Change in our political system requires participation (so said those who built the system).

I had no money, power, connections, or family influence to start - after volunteering and getting it done in one campaign, I was invited to a paid role in many others (and for a time served as a consultant and as a chairman of a county-level party organization) - and I helped to recruit and elect some good people (and to unelect others who didn't get it).

Sure wish others would take the time, put their energy and money into the process, and help to change things! I am no longer as active, but I sure do stay informed and vote. When good people don't participate, bad people have a free reign.

This is true for the future of Ham radio, freedom of speech, and many other freedoms that many in government believe we should not have. Sure wish I could figure out who to support in 2000! :-)

Are you sure you want a 'boatanchor' receiver for this purpose? You can probably get a perfectly fine old receiver from the 1940s or 50s in that price range, but you can also get a modern solid state receiver with digital readouts, memories, and lots of other nice features for about the same money. I'm a great admirer of boatanchor stuff (I come from the boatanchor epoch :-) but you might want something more reliable and less trouble to operate, that won't kill the kid's interest with its complexity. I mean, do you really want to make your kids master the operation of a Q-multiplier? Just a thought.

Having said that, there's tons of pictures and info on old receivers at

http://www.aade.com/hampedia/hampedia.htm

This is a great site for pix of old ham and swl gear. Best of luck.

> Pro or Con about the radio,in day to day use? Range on simplex,
> intermod/interference rejection,ect?

I've only had my DJ-S11 for two days, but so far so good; I didn't get great signal reports when I wasn't looking down the throat of the repeater, but I could check into the linked net from the dining table via a node several miles away.

I haven't had intermod on th S11 yet; I do get it on the S41, and expect I'll get pager/weather-radio mixing if I take it out in China Town or South Station. (direct line of site to Blue Hills Observatory NOAA/NWS Wx-radio site AND all the pager sites, known locally as Intermod Alley; several local repetears are at frequencies that are mixing values of Wx and a pager, I've noticed with my wide-open scanner. this is why my mobile is old enough to have helical filters rather than extended receive.)

I liked the DJ-S41 well enough to buy the S11. My early report on the S41 is at http://world.std.com/~wdr/alinco.html , but be warned some of my comments need updating "in my copious spare time" (1. It works ok in the truck if the windows are toward the receiver; 2. The only passive radiator scheme I've heard of that helps is putting it at driven position in a Yagi array; 3. The S41 wideband mod supposedly works for Mars/Cap on S11, but I haven't tried and wouldn't recommend it.)

Tech America, the new Tandy division with them on sale at $88 each, is http://www.techam.com/ and seem to be good folks, what Allied Radio and Lafayette used to be. The president's letter has a callsign at the bottom ...

Have to raise some money to put towards an engagement ring; so here goes
a lot of good stuff!

IC-27A 2 Meter mobile - sold as is $200. Needs a new battery for the
memories as they can get lost from time to time.

Ameritron AL-811 HF amplifier WITH the Ameritron QSK-5 2.5KW QSK T/R
switch for ease in digital HF communications. Asking $600 for both.

Icom IC-730 HF transmitter - All HF bands (WARC included) output anywhere
from 100 miliwatts to 100 Watts out. A QRP'ers dream! $400.

Icom IC-471A all mode 440 MHz radio with the sub-audible tone encoder
included. $500.

MFJ-941E Antenna Tuner - $100

MFJ-1786 Hi-Q Super Loop Antenna for 20 Mtrs and up - $200

SHF Sysytems Mode S Converter for satellite communications - $200

Heath HW-9 QRP rig with the matching QRP antenna tuner and QRP watt meter
$250 as a package.

Prices do not include shipping.

All this stuff is in GREAT condition! I'd like to keep it; but I gotta buy
a diamond and I hope this will help get me there! Send all correspondence
to my e-mail address.

SUBJECT: Needed - 6 Meter Conversion information for GE DELTA-S mobile
radio.

GE Delta-S transceiver, * 36-42MHz split *. Need board modifications
for:
1. To relock the VCO after programming HAM 6 meter frequencies
into it.
2. TX Filter modifications/tuning.
3. RX Filter modifications/tuning.
4. P.A. (RF Power Amp) deck modifications/tuning.
5. Low Pass filter (just prior to PL-259 attached to the P.A.)
modifications/tuning.
I'd rather not bypass (cut out) this filter.

Would like:
1. MAXIMUM channels available 'per mode' using a S-825 control
head. I have the
original (8 Channel) control head, a S-550 (16 channel
control head),
and a S-825 Control head (multiple 'modes' of HOW MANY
channels?).
Also have the software/hardware for programming the S-825
control
head
2. Pointers on how to program it using the S-825 control head
programming software/
PC interface. I HEX-EDIT "hacked" a 42-50 frequency file
into the 36-42 format
and programmed the control head but maybe there is

another (better?) way.
The software would not take any frequency above 52MHz
when attempting to
program a "36-42 split" Delta-S using the (undocumented)
Control-E override.
3. Information on factory rated Watts - power output for mobile
low band VHF Delta-S units.

3522. Power jack on Yaesu FT50

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-21 00:00:00 UTC
From: Ken Harris <kjh@shoreline-studios.com>
Message-ID: <3476218D.794B@shoreline-studios.com>
Source record: 161348

What are the specs on the power jack used in the
Yaesu FT50? I found one labeled "1.3mm, walkman type", but
the inner diameter was too small. Who carries these?

I want to make up a cable to power the radio from
12 volts.

It's really not very hard to do. Change the crystal in the Channel Element, do some minor re-tuning to peak the sensativity, and you're in business. I've got a pair of them running on 145.01 and 145.05. I try and have them checked with a service monitor at least once a year... and after the first 3 weeeks or so of "burn-in" the rigs stay on the frequency that they were tuned to.

3527. How to buy all the new equipment you need . . .

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-21 00:00:00 UTC
From: meeeeee989@aol.com
Message-ID: <19971121123000.HAA01879@ladder01.news.aol.com>
Source record: 161353

DO YOU WANT TO MAKE BUCKS FAST???--AND NO ONE LOSES . . .
Of course you do, we all do !!! Here's how to do so with little effort, and, yes IT'S LEGAL.

Some people make things happen
Some watch things happen
While others wonder what has happened

This is the easiest way that you can make a buck. Think how excited you'll be to open up your mailbox day after day! Will it be $50 in dollar bills? or $5,000? Start making your plans, because it can happen to you.

DON'T PASS UP THIS ONCE IN A LIFETIME OPPORTUNITY!!! (I'm glad I didn't)

Like you're doing now, I was checking out newsgroups and came across an article similar to this that said you could make thousands of dollars within weeks, with only an initial investment of $6.00! So I thought, "Yeah, right, this must be a scam!", but, like most of us, I was curious; I kept reading.

Anyway, it said that if you send $1.00 to each of the 6 names and addresses stated in the article, you could make thousands in a very short period of time. You then place your own name and address at the bottom of the list at #6, and post the article to at least 200 newsgroups.(There are about 22,000.)

No catch, that was it. After thinking much about it, I came to the conclusion that this could not be a scam (but, if it was, only scamed out of $6 , I could afford it.)

Even though the investment was a measly $6, I had three questions that needed to be answered before I could get involved in this sort of thing. Just like you, I was skeptical, or thought it might take too much work or something.

1. Is this really legal? . . . I called a lawyer first. This lawyer friend was a little unbelieving that I would actually make any money but he said it WAS LEGAL if I wanted to try it. I told him it sounded a lot like a chain letter but the details of the system (SEE BELOW) actually made it a legitimate legal business.

2. Would the Post Office be ok with this . . . I called them: 1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL! (See Title 18,h sections 1302 NS 1341 of Postal Lottery Laws). This clarifies the program of collecting names and addresses for a mailing list.

3. Is this moral? Well, everyone who sends me a buck has a good chance of getting A LOT of money . . . a much better chance than buying a lottery ticket!!! In the end it looks to me like no one loses, we help each other move ahead.

So, having these questions answered, I invested EXACTLY $7.92 ... six $1.00 bills and six 32 cent postage stamps . . . and boy am I glad I did !!!

Within 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But the money just continued coming in. In my first week, I made about $20.00 to $30.00 dollars. By the end of the second week I had a mad total of $1,000.00 !!!!! In the third week I had over $10,000.00 and it was still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in . . . It's certainly worth $6.00 and 6 stamps !!!

So now I'm reposting this so I can make even more money! (and helping you to make a lot of money.) The *ONLY* thing stopping *ANYONE* from increasing their own bank account is pure laziness ! It took me all of 5 MINUTES to print this out, follow the directions, and begin posting to newsgroups. It took me a mere 45 minutes to post to over 200 newsgroups. And for this GRAND TOTAL investment of $7.92 (US) and under ONE HOUR of my time, I have reaped an incredible amount of money --like nothing I've ever even heard of anywhere before ! Enough said, time to start !

Let me tell you HOW this works, and most importantly, WHY it works. Also, make sure you print a copy of this article now, so you can get the information off of it when you need it. The process is very simple and consists of THREE easy steps:
STEP 1--Send the 6 people on the list a single dollar each.
STEP 2--Put your name and address on the list in position 6.
STEP 3--Post this amended letter to 200 (or more!) Newsgroups.

==========
HOW IT WORKS
==========

STEP 1:

Get 6 separate pieces of paper and write the following on each piece of paper:

PLEASE ADD ME TO YOUR MAILING LIST.
$1 US DOLLAR PROCESSING FEE IS INCLUDED.

(This is the key as this is what makes it legal since you are paying for and later offfering a service.)

Now get 6 $1.00 bills and place ONE bill inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope to prevent theft/robbery. Then, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase and a U.S. $1.00 bill. Now send to:

#1
JA Gualtieri
45-350 Columbia St. W.
Waterloo, ON, Canada N2L 6G3

#2
Andrew Wiggin

PO BOX 424
East Setauket, NY 11733

#3
Ashle
347 Jamboree
Manchester, MO 63021

#4
The Mom
4464 Castelar Street, #320
San Diego, CA 92107

#5
Chris Watson
1138 Indian Road
Virginia Beach, VA 23451

#6
Virgil
3538 West 12th Street
Trainer, PA 19061-5301

STEP 2: Now delete name #1, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR name as number 6 on the list. (If you want to remain anonymous, put a nickname, but the address MUST be correct, or you won't receive your dollars in the mail.)

STEP 3: Now post your amended article to at least 200 newsgroups. Remember, 200 postings is just a guideline. The more you post, the more money you make! As you might know, it's not that difficult to post to news groups. So, you don't know HOW to post in the news groups? Well, do exactly the following:

HOW TO POST TO NEWSGROUPS FAST WITH YOUR WEB BROWSER:

Highlight and COPY(Ctrl-C) the text of this posted message and PASTE(Ctrl-V) it into a plain text editor (like Wordpad or WordPerfect) and save it. After you have made the necessary changes that are stated above, simply select a newsgroup then COPY(Ctrl-C) and PASTE(Ctrl-V) the text into the message composition window of the newsgroup, and post it!

GENERAL NOTES ON POSTING: A nice page where you'll find all the newsgroups if you want help is http://www.liszt.com/ (When you go to the home page, click on the link 'Newsgroup Directory'). But I don't think you'll have any problem posting because it's very easy once you've found the newsgroups. All these web browsers are similar. It doesn't matter which one you have (But it makes it very easy if you have Netscape Navigator 3.0 or later. You may download it from the Internet if you don't have it.) You just have to remember the basic steps, stated below.

BASIC STEPS FOR POSTING:
1. Find a newsgroup and you click on it.
2. You click on 'POST AN/NEW ARTICLE' or 'TO NEWS' or anything else similar to

these.
3. You type your flashy headline in the subject box.
4. Now, either you attach the file containing your amended letter, or you PASTE the letter.(You have to COPY it from the text editor, of course, from before.)
5. Finally, you click on 'SEND' or 'POST' or 'OK', whatever is there.

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200

That's it! You will begin receiving money from around the world within day's! You may eventually want to rent a P.O. Box due to the large amount of mail you receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it.

JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.

==========
Now the WHY part:
==========
Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625.00! With a original investment of only $6.00! AMAZING! And as I said 5 responses is actually VERY LOW! Average is probable 20 to 30!

So lets put those figures at just 15 responses you get. Here is what you will make:

at #6 $15.00

at #5 $225.00

at #4 $3,375.00

at #3 $50,625.00

at #2 $759,375.00

at #1 $11,390,625.00

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is, do you realize that thousands of people all over the world are joining the internet and reading these articles everyday, JUST LIKE YOU are now!! So can

you afford $6.00 and see if it really works?? I think so...

People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet. Remember, play FAIRLY and HONESTLY and this will work. We all just have to be honest and help each other get ahead.

REMEMBER-HONESTY IS THE BEST POLICY. WHAT ARE 6 DOLLARS TO YOU? YOU DON'T NEED TO CHEAT THIS IDEA TO MAKE MONEY!!! IF YOU NEEDTHE $6, I'M SURE ANY OF THE PEOPLE ON THE LIST AHEAD OF YOU WOULD SEND YOU $6 IN DOLLAR BILLS TO GET GOING--YOU HAVE NOTHING TO LOSE !!

** We will monitor the program and if we find you have cheated by not sending your money to your five recipients, we will just dump you out of the system. Come on folks, let's work together and make this work for everyone.

GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH.

Please remember to declare your extra income. Thanks once again...

3528. Icom IC-900 Band Pack 440mc

Hello All;
I am selling the Kenwood PS-50 power supply. It has less then
five hours of use. I'm the 2nd owner. Both of us are nonsmokers.
Asking $150+shipping. PS-50 with cover & original carton. No CODs
Reason for selling is strictly financial. Please re:me via through
Packet: N2RIF@WM2f.#SNJ.NJ.USA.NA
Or Better
Email: n2rif@amsat.org
My phone# is: (609) 386-9382 but sorry it is busy most of the time.
You can try though anytime from 10am to 10pm ET..
Thank you for reading my sale's bulletin.
de Thomas J or Just T.j. -73
P.S. The power connector will fit all Kenwood and almost all
HF & vhf/uhf allmode Icom Radios.

Gary:

Are you familiar with Rhapsody, which Apple just bought and is
(surprise!)
making an open system?

I just spoke with a friend who was on the development team and who may
consult with
Apple, he says it is a genuine competitor to Windows95, will quickly
replace Linux (it's
free as well), and is a wonderful operating system to work with.

Guess the amateur radio fraternity will need to get ahold of it if it is
to become practical -
sort of like Lojack, cell phones, etc., etc.

Intriguing! :-) 73, DavidC AA1FA

The above information is wrong. It is in fact possible to encode and decode simultaneously. The manual is confusing, but experimentation proved that when set in the CT mode, the unit does infact simultaneously encode and decode. Sorry for the confusion.

And even that may not save you. Some years ago, the FCC and Coast
Guard raided a pirate broadcast ship operating in international waters.
Somehow in the process of the raid, the ship sank. I doubt this was
accidental.

The US has recently shown that it has little or no regard for international
law, or for the soverignty of other nations. It routinely captures ships of
other nations in international waters (which under international law is an
act of war). It has kidnapped foreign nationals in foreign nations. It has
even assaulted a friendly foreign power and kidnapped its head of state.
Only if it faces military opposition which make its actions too costly does
it refrain from acting. So you shouldn't expect international law to protect
you unless you have the military might to back it up, IE you'd better be
under the protection of a nuclear power with the capability of obliterating
Washington. Anything less doesn't seem to restrain the arrogance of
power there.

Others have done a good synopsis of the various license stages in Canada.

For more details, you might want to check the website for the national organization, the Radio Amateurs of Canada at http://www.rac.ca

It goes into more details about this and other Canadian amateur radio issues. They're also working with RAQI, the Quebec provincial organization, to ensure the information is available in French.

I want to trade Winged emblem Collins S-line for Drake TR-7/R-7.

Collins winged emblem S-line consists of
75S-3B, CCA grade Very Good.
32S-3, CCA grade Very Good to Excellent.
312B-4, CCA grade Very Good
516F-2, no cabinet
All work great. Clean inside and outside.

Drake TR-7(A) and R-7(A) combination.
TR-7 must have a digital display (DR-7), and NB-7 and filters.
R-7 also needs NB-7A and filters.

With many accessory like PS-7, External VFO(RV-7 or RV-75),
External speaker(MS-7), Connecting cable, RF processor, fan, wattmeter
etc...
I will add 500Hz CW filter and DX Engineering RF speech processor.

Please email me.

I do not have any experience with the FT-290R Mk II,
however, I do own an FT-690R MkII and I believe the two
radios are nearly identical.

You will have to purchase an optional tone board and install
it. The tone board will enable you to program one PL tone
frequency via dip switches. It is encode only.

Wanted: Saber III, Systems Saber or HT-1000 (16/32 Channel w/Scan Option).
Radio must be in 470-512 Mhz range.

Currently in possession of an 8 Channel HT-1000 470-520 Mhz and would like
to trade towards (radio and payment or some other terms) one of the above
radios or if possible convert my 8 channel to a 16 Channel. Any info would
be greatly appreciated.

Thanx. Please contact via E-mail.

Ron

Most likely, there is a failure in the SSB generator/switching circutry.
A block diagram should make the problem easy to localize.

I have an excellent condition Yaesu FT290R II 2-meter allmode mobile.
It is the current model sold at HRO for $599.95 (page 33).
It does FM/SSB/CW on 2 meters with 25 W output. PL encoder installed.
10 memories.
Includes manuals, mounting brackets, box.
Price is $425 + shipping from California.
If interested, please call 9am-5pm 818-773-0330 extension 409 or
6pm-10pm 818-882-0101.
If you are in Los Angeles, you are welcome to come take a look at it.
Thank you.

The new trend is to get an operating system that works, not to sucker clients into spending 20's of thousands of dollars each upgrade. Of course the managers get their way and an upgrade about ever six months. That causes problem because now the saved files are not compatible with the oid ones. And who sells most of the desktop packages (Duh, Gates, Wintel).

Source record: 161426

I bought a Kenwood TH-G71A a few days ago and have some information for those considering buying one. The transciever seems to be ruggedly built, it's case is entirely high-impact plastic with the battery attaching to the rear using a clamshell type of design. The unit is larger than an FT50 and fits well in my hand. The controls are well thought out and operate in a logical way. The display is easy to read, and it, and the keypad can be illuminated. The audio output is very good, and the transmit audio is crisp. The receiver seems to be very sensitive much less prone to interference from strong off frequency signals than the FT50. I have not found any birdies yet. The receiver covers from 118-174 and 400-470MHz. The only drawback I've found is that it cannot encode and decode ctcss simultaneously. If you enable ctcss decode on a channel where you are set to encode, it shuts the encoding off. This is set out in the manual and obviously a design flaw. Fortunately, I don't find it necessary to use ctscc decode. All considered, I'd highly recommend the unit.

Obviously you never have to work away from the office. Laptops are one of the
best tools since the invention of the computer. They allow you to bring the
power of the computer out into the field, and that's necessary for those who
aren't cubicle drones.

> BTW, the only programs I have seen that would totally screw up under DOS used
>Pharr-Lapp DOS extenders. Almost all of my DOSware and w3.1 stuff is adequate
>to task. The only reason I have for using 95 or NT is because I am forced into
>it by clients that have been suckered into using it corporately because they
>just had to have the latest $5,000.00 CAD package or something.

The need to run 32 bit applications is a powerful incentive to switch
operating systems. A 16 bit OS *needs* third party extenders to run
today's more powerful programs, and as you note, those extenders
cause problems. A 32 bit OS doesn't need those things, and lets you
consistently use large model programs. Win95 and NT also offer
real multitasking, and allow the cooperative use of a suite of programs
to attack a problem. That multiplies your efficiency compared to a single
tasking system's more limiting linear approach.

I must echo Bob's remark that Win95 handles unruly DOS apps
much better than Win 3.1 did, and sometimes better than DOS
itself did. And of course it runs 32 bit apps that Win 3.1 can't.
That doesn't make me a *fan* of Win95. I much prefer Linux.
But I can't get all the apps I want to run to function under
Linux (yet), so I'm stuck with having to have a Microsoft OS
available. And if I must use a Microsoft OS, I much prefer Win95

to Win 3.1.

What I *hate* about Windows (of all varieties) is the way it tries
to *hide* things from the user. With Linux, everything is out in
the open. When the disk mysteriously rattles, you can look and
see what's going on. With Windows, it is often a mystery.

That is a irrational statement here. I dare say that 75% of all QSO's
on the amatuer band are CW. All you have proven as that in the W1 QSL
bureau most hams that send QSL cards use CW. That is all, nothing
more or nothing less.
Just because he sees more QSL cards are for CW contacts, he make the
assumption that more contacts are via CW. That's like asking the
general public if they like carrots. If only the ones who reply are
the ones who hate carrots. You make an assuption that most people
don't like carrots. Something like a straw poll. Not worth a tinkers
D$%$^#.
>
>For those of you who will take exception to the "CW requirement" for the
>internet...Lighten up or get a life!

I ask what is the relavence of proficiency in one form of
communications a mandate to priviledges that are not even related to
this mode of communicatoins?
Does it mean that someone who doesn't like one aspect of amatuer radio
should not have priviledges in another area?
Do you subscribe to the theory that I had to do it so everyone else
after me must also?
I wonder if someone jumped off a bridge, would you?

PREMIER Communications Press Release #0018
21 November 1997

ADI SPECIALS FOR THE MONTH OF DECEMBER!

Time is running out on your chance to get two of the Best Values in Amateur Radio, at an even more affordable price. Both of our current special pricing offers will end on December 31, 1997.

That means that you can only get $30 off the AT-600 and AT-600HP Dualband handhelds for just a few more weeks! Likewise, our $20 mail-in rebate on the AT-201 Two Meter HT is also coming to an end.

Both radios make excellent Christmas gifts for others, or a great holiday "bonus" for yourself. To order call your local ham store. Better hurry, before time runs out!

A NOTE ON UNSOLICITED COMMERCIAL E-MAIL

Recently we sent out a -very- small number of unsolicited e-mails promoting our website. However, in light of the very strong reaction of a number of folks who received the e-mail, we have discontinued that practice, effective immediately. We apologize to everyone who was offended by our use of the Internet in this manner.

Whether the act of using electronic mail to send unsolicited advertisements is "acceptable" is entirely a matter of debate, one that whole newsgroups are devoted to. We make no judgements about whether it is "acceptable" or not.

The practice is definetly growing in popularity, and is here to stay. Even though we, at ADI, have chosen not to use this method of marketing, other companies certainly will. In hindsight, our use of direct e-mail marketing was obviously a mistake on our part, and we have no intention of repeating it.

>radios both hand held and mobile. Are they better than the others????
>Looking to buy the best QUALITY available.
>
>

I own and have owned several Standard VHF/UHF radios. All have performed flawlessly and had:
1. Better than average receivers, frequently significantly more sensitive;
2. Best intermod rejection I've seen except in commercial equipment;
3. Great transmit audio--people frequently comment unsolicitedly;
4. Good construction quality, tight fit, etc.

Personally, I think they are just a cut above the big three manufacturers.

73, Dave AA5NU

Hello ,
Don't downgrade to a FT8100! I had such a radio for a few days because i thought the
reveiver was better. Not Mine. The two meter receiver was full of unwanted sounds.
The next day the software locked up. The tx was not able to switch off the transmitter once it was switched on.
But beside I was the unlucky onwner of a unit defect out of the box. I found the 8100 not very user friendly
especially in the car The button are very tiny and the characters on the buttons on the display also.
Wihout a manual its hard to programm the unit. I really love the kenwood tm-v7. There is a whole user guide on board! And what you said about the unlighted side buttons. No problem at all. You can FEEL the buttons. Also no problem with the display. You can make a daylight and a nightlight PM as you wish.
I found the receive audio on the 8100 slightly better.
The 8100 has also no ctcss decode . Its an option.
I am happy that I send back my 8100.
good luck.

3586. Re: Mods Kenwood Th-G71A

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-22 00:00:00 UTC
From: Kevin Swanson <kevin4321@email.msn.com>
Message-ID: <uQtLV7398GA.207@upnetnews03>
Source record: 161186

I started pulling out diodes in my new TH-G71A and found 320-400mhz &
800-950mhz RX in the radio. CELLULAR IS BLOCKED. :(It also TX 136-174 and
400-470.

Its simple. Cut the green wire on the lower right hand corner of the back
side of the keypad. Next remove the diode to the left of the one in the
white square (the one in the square is the same as cutting the green wire).

Heres what I found:
Cutting only the green wire ONLY opens TX to 142-152 & 420-450.
Taking out the diode ONLY makes it RX and TX only in the ham band.
Taking out both will open 320-400mhz & 800-950mhz (minus cellular) RX and
136-174 and 400-470 TX.

If someone finds how to open the cellular let me know.

Sell Cassiopeia A10 2 MB handheld PC.
Pictured in Office Max or Global Catalog.

6 mos old, as unused. (Scrapped project at sisters company).

This runs Windows CE, comes with built in Excel, Word and organizer.
Great for e-mail if you add PCMCIA modem. (very cool)
Possible great contest logger or Packet use.

Comes with accessory CD, cable to hook to desktop PC and power saver disk.
Tested 100% good (hardly used ever!)

Sell for *Best Offers* or swap for nice Ham H/T.

For Sale: Kenwood TS130V qrp rig, baby brother of the TS130. Same features except runs 15-20 watts out. Includes matching power supply, speaker, and 270 Hz CW filter (installed). One of the very few full featured commercial qrp rigs ever available in the US. In very good condition, works great.

$550 shipped

Alan, N3BJ

3595. Re: Comments: IC 730 Anyone?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-22 00:00:00 UTC
From: rfman@mindspring.com
Message-ID: <657eg1$m7j@camel18.mindspring.com>
Source record: 161195

I had a 730 when it first came out. I liked it alot. I replaced
it with a 735 because of the extra bells and whisles and
general coverage receive. I have to say I was disappointed
in the 735 after using the 730. As a matter of fact if you
compare the receiver specs. with the rest of the Icom
line, you need to spend a lot of money to get a better
receiver. Try a 781, 756, 775 for better receiver specs.
If you just want a basic radio that transmits and recieves
well and don't need all the extra memories and such, a 730
in good shape will be a great buy. Good Luck

Oh no one of those! Likes to keep his ball and not let anyone else
share unless they meet up to their expectations.

A smaller amatuer radio market will mean ever higher costs for new
equipment. Smaller numbers also mean less political muscle when it
comes to attacks on the bands that are already in use. To those
amatuer operators that subscribe to the 1920's, the times are a
changing. I would not be suprised if more of the UHF and higher bands
come under attack from commercial interests. These people have power
and if the population of the amatuer service remains the same or
dwindles the hobby will also. It is estimated the frequencies
assigned to the amatuer band exclusively would bring to the federal
government about 30 to 60 BILLION dollars based on the last PCS
auction inthe 900 MHZ range. That's alot bucks there for politicians
to spend. Numbers in any radio service acan help to fight the money
grabbing poloticians and commercial interests that stand to make more
than the frequencies are wortth.

That's my penny's worth

the th-79ad cannot be made to rx 800 mhz. the parts for that are not included in the radio, possibly older models were able to do that.

to lock out the unwanted channel from the scan list you press function then 0, that will cause the radio to skip that channel when scanning

you can get the manual from kenwood, i lost mine and they sent me one for free

The early model 79's could receive cellular, the later could not. It breaks about the 79A to 79AD designation. I don't have the S/N break point at home..

3611. Radio Review Sites?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-22 00:00:00 UTC
From: Laird Allshouse <lairda@ncentral.com>
Message-ID: <657spj$p49@news1.zippo.com>
Source record: 161211
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I just read Gordon West's CQ-VHF magazine review of the ADI AT-600, which was available at ADI's web site.

Does anyone know of internet sites where similar reviews, taken from ham radio magazines, are available. I am particularly interested in handheld 2 meter and 440 radios.

No doubt the magazines are reluctant to authorize publishing these articles. If I had a decent library within 100 miles, that would solve the problem.

Regards,

Laird

Only if absolutely necessary. I want to exhaust all other avenues first,
but I fear that the number of those avenues is steadily shrinking. I am
against initiating violence, but if attacked, I will be forced to defend

myself.
>
> We have not exhausted all other remedies. We have other ways to alter

> Violence is a last resort, and should not even be considered until all other
> avenues have been exhausted. And even then we have to ask ourselves
> if it is worth the price, because that price is heavy indeed.

The ballot box no longer matters, because all the election are rigged.
Every assembly and protest that the govt doesn't like is broken up by
force. Every petition is ignored. Civil disobedience worked for Gandhi and
MLK, and I'm willing to try it for as long as possible. But once the govt
declares war on us, we may have to fight back.
>
> Government use of paramilitary force against its citizens is provocative,

This is true, and this is what worked for Gandhi.

3621. more FT727 help

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-22 00:00:00 UTC
From: David Foster <dfoster@pdq.net>
Message-ID: <3477C1BB.3D021AF6@pdq.net>
Source record: 161221

I have a Yeasu 727 dual band. Still New in box.
I need a reset code that will do two things at once, change the
radio to wide transmit/treceice (450-470mhz) and change the
channel spacing to 12.5 khz.
The normal wide band code - 110000 will give me wide band but
leaves the channel spacing as 10 and 20 khz.
code 660100 will give me 12.5 splits but leaves me stuck in 70cm.
Any help?

DF

3627. FS: ICOM IC-W2A Dual-band (Plus acces.)

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-22 00:00:00 UTC
From: Mike Schwendeman <mikeats3@rconnect.com>
Message-ID: <347721C5.337@rconnect.com>
Source record: 161227

Good day;

I have an ICOM IC-W2A dual band handheld for sale. It includes:

(1) IC-W2A radio (Dual band; VHF and UHF)
(2) Standard wall charger
(3) Drop-in quick charger
(4) Hand held "mini" (Icom) speaker-mic
(5) Two batteries
(6) Original box and manual/paperwork

All items work fine. The radio is modified to operate "out of
band", so it works in the commercial bands just fine. The receiver
covers aircraft, all ham/commercial as well as the 800 Mhz and cellular
frequencies.

I am asking $250.00 for all

Mike Schwendeman

3629. NEW FT-847 PRICE !!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-22 00:00:00 UTC
From: Felix <hershman@ix.netcom.com>
Message-ID: <347777BE.E978BD72@ix.netcom.com>
Source record: 161229

Finally Yaesu Japan has put the FT-847 on their Web Site under "NEW PRODUCTS".
The price is 210,000 Yen or about $1700 USA Dollars. The Japanese price for the FT-920 is 198,000 Yen to help give you a comparison.
Still no info as to a built in Antenna tuner. If you look closely at the picture there is abutton for tune. However, it could be to an external unit. The Radio greatly resembles the Kenwood Ts-570D model. The DSP has "TWIN SLOPE TUNING" but the radio still has an IF shift control.
The New IC-746 has TWIN Passband Tuning but no Slope tunign for the DSP.
Both radios shoul be out bu February/ March 1998 in the USA.
Steve NS1R

Mack,
I have a 730 and it is a fine and tough rig. Mine got so scratched up
and dinged that I spray painted it with some artsy-fartsy speckled paint
charcoal and deep sky blue colors. sounds awful I know, but it is a
tough and course coat and don't show no mo scratches! Got mine new in
'84 or '85 never had to have it serviced.
Take the top cover off and there is a swithc throw it one way and you
have a qrp rig with rf power switch turned down you go as low as 4
watts. I don't travel anymore and have dedicated min to qrp. I have
DXCC and I used only mobile contacts to get it!

How much they asking for it? Just curious.

3632. Deep cycle batteries vs. power supplies

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-22 00:00:00 UTC
From: n8kjt@juno.COM
Message-ID: <19971122.120126.3214.1.n8kjt@juno.com>
Source record: 161232

I have used deep cycle batteries with a power supply to charge them for
years now
with good results. I started with 375 AH floor scrubber batteries and
they ran my 4 port packet BBS for 6 years till they started giving me
trouble. My packet setup uses
70+ amps when all ports are xmitting the same time (it does happen), and
there is
power to spare.
I have just replaced these batteries with a pair of 6V golf car batteries
from Sears. They are reasonably priced (about $50 ea). My local Sears
them ondisplay but had to order them for me.
Keep in mind, they do emit hydrogen gas, particularly if they are
overcharged. My shack has plenty of air leaks so ventilation has not
been a problem.

See posting "want ICW32A mods" by jon, dated 11/11/97, this group.
The radio has much better transmit performance than the FT-50, and is
amazingly simple to use. The recieve performance is not as good as the
FT-50, but it is satisfactory.

3638. Need help with Kenwood TH-79A

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-22 00:00:00 UTC
From: precision_point@mindspring.com
Message-ID: <3477059a.4117242@news.mindspring.com>
Source record: 161294

I just recently got a Kenwood TH-79A dual band HT and didn't get the manual with it. First of all, does anyone have one that could make me a copy of? I'll pay any resonable charges.

But in the meantime, I have a couple of questions. I have pretty much figured out almost all the controls, but how do you block certain freqs that are in memory so they are not scanned when in scan mode? Also, someone told me it will also pick up AM and FM radio? If this is true, what is the function to do that?

And what about an 800MHz mod? I've been told it could be done by some people and it can't by others. Which is true?

Thank you for any help you can give.

Source record: 161305

Hi Fellas;
I have for sale the same Collins 75S-1 that I listed before. There were interested parties but they lost interest, I guess because I could'nt answer thier questions fast enough. The RCVR was packed away.
It has the WATERS Notch filter mod w/ paperwork and manual for the rcvr.
Has the wrong feet and the lid has two hole like the kwm-2 has for the hold-down zues fasteners. At first it appears to be a kwm-2 cabinet but there are no holes in the sides for the PM-2 supply holdon screws.
Front panel has no marks but is dusty, rcvr plays fine.
All the paperwork is there, needs an easy cleaning of the front panel. Just a few little chips on the bezel(trim ring), wrong feet.
I don't suspect that it would take 1 hour to clean it up, replace feet and it would look darn good.
Thanks for your patience and 73.....Rich WA2RQY

Have you tried Tucker Electronics in Garland, TX (214 area code)? Their
prices are high compared to, say, Ed Matsuda's, but they can sell you a
copy of almost every manual imaginable.

>coming, and it won't be pretty.

Think long and hard about that. Guerrilla war is ugly, prolonged, bloody,
and it is seldom successful. If you aren't ready to die for the cause, and
you probably will, or if you aren't prepared to kill a lot of innocents, and
you probably must, don't even think about such a course. It makes a fine
romantic fantasy for the armchair adventurer, but the real thing is something
else. A real guerrilla war in this country would make the Civil War pale by
comparison. The human costs would be enormous. Are you prepared to
pay those costs? Are you prepared to make your family pay those costs?

We have not exhausted all other remedies. We have other ways to alter
government policies than guerrilla war. Lets use them instead. We still
have the ballot box. We should work to throw out those who arrogantly
abuse the rights of American citizens. We still have the right to petition
and lobby, to assemble and protest. We can use jury nullification to send
a message. And if all that fails, we have non-violent civil disobedience.

Violence is a last resort, and should not even be considered until all other avenues have been exhausted. And even then we have to ask ourselves if it is worth the price, because that price is heavy indeed.

We all feel the enroachments of government into our lives. It can seem that the walls are closing in and there is no escape. Everywhere you turn there is another enroachment, another limit placed on our freedom of action. We feel that we are no longer in control of our own lives and destinies. Anything can push us over the edge, even as trivial and unimportant an issue as hobby pirate radio. And if we go over that edge, our natural tendency is to lash out. That is simple, basic, and raw, but that is rarely an answer. It is usually self-defeating and self-destructive. Real solutions are rarely that simple, or that easy.

Government use of paramilitary force against its citizens is provocative, perhaps deliberately so. We must resist the tendency to fall into their trap. They want us to react violently. It justifies their actions post hoc. And it gives them an excuse to impose further limits on our freedoms. We must avoid playing the game by their rules. We must change the nature of the game in ways that they don't understand, and in ways to which they don't know how to respond. We must resist in ways which make use of military force against us fruitless.

We must make them look the fool and the villian in the eyes of the public, and ultimately in their own eyes. The Russians have an insult, "no culture", which is one of the most devastating things they can call someone. No one wants to be thought of as being an uncouth barbarian lout, certainly not government functionaries. Making paramilitary forces look and feel like the Keystone Cops is probably one of the most effective weapons we have to use against them.

3668. First Radio for New Ham

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-22 00:00:00 UTC
From: dieter@touch_my_monkey.com
Message-ID: <34765c08.2087699@nntp.ix.netcom.com>
Source record: 161324

I just passed my no-code Technician tests. I would like some opinions on what my first transceiver should be. I would like above average quality, but not necessarily the best and the newest. I would also like to be able to use this in my car and in my house. Right now I would like to be able to transmit and receive without a tower antenna outside.

I will appreciate any help that you can give me. Also, any recommendations of mail order houses or stores in the Chicagoland area will be appreciated.

Thanks.

>an SWR of 1.5 or less on 20 meters.

I have the same problem except that the same happens on 17 meter. With the
TS-50S I use /M connected all is perfect but when I use the TS-450SAT the SWR
goes in all directions making tuning impossible. On 20 meter the trx even cuts
back the power when SWR rise too high...

I'd love to solve this problem since the TS-50 is not really a perfect home
rig.

TNX for any replies.

3M/WOLLENSACK STEREOPHONIC COMPACT REEL TO REEL TAPE
RECORDER

Best offer in the $100-$200 range takes it today 11/22/97.

I'll the best earliest cash offer in the above $ range by
the end of today, Saturday, 11/22/97 12:00 Midnite E.S.T.

MAKE AN OFFER--YOU MIGHT END UP WITH A VERY NICE UNIT!!!

- THIS IS A GREAT COMPACT PORTABLE COMMERCIAL QUALITY UNIT
FROM EITHER THE LATE 1950'S OR 1960'S. WOLLENSAK MADE
HIGH QUALITY EXPENSIVE UNITS AS WE ALL KNOW.

- GREAT UNIT FOR REEL TO REEL COLLECTORS OR FOR SOMEONE
WHO JUST WANTS A GOOD OLD FASHIONED HIGH QUALITY UNIT.

It's the stereo version of the monophonic model 15-70.

Nice sounding and running unit for it's age. Very impressive
compact portable high end unit.

Mostly chrome or stainless steel case. Metal speaker grill
has some light rust in parts that can be easily taken care
of to make it perfect.

- SIZE (APPROX.)

6 3/4" HIGH x 11 3/4" WIDE x 10 5/8" DEEP

- WEIGHT (APPROX.)

18 pounds (fan cooled)

- BACK PLATE INFO

DES. NO. 185,262

PAT. NO. 2,877,958
2,942,875

Dual 3 3/4 & 7 1/2 IPS tape playing speeds.

ILLUMINATED COMBINATION KNOBS:

- Volume/Auto. Record Level

- Tone/Treble/Bass/Off

- Record Level Meter

INPUT JACKS

- Radio/Phono

- Microphone

OUTPUT JACKS

- Speaker Switch/Record Only

- Accessory Amp

- Earphone/Speakers

TRACK SELECTOR CHART IN UNIT'S COVER

- 2T monaural or stereo
- 4T stereo
- 4 monaural tracks

(It does not have 1/4 track or 1/2 track switch, so this labeling is confusing to me)

Has standard record, play, rewind & forward controls

Cannot get the digital tape counter to work is the unit's only short coming. I would guess that's an adjustment and I'll leave that to the buyer.

Handles 7 inch reels.

Does not include microphone.

Do not know if it's tube or solid state. Can't look inside. Don't want to take apart a unit that is running fine.

Plus shipping and handling which won't be much, because I'll pack it free (the buyer will save there). Also, to show my gratitude to the buyer, I'll bring it directly to UPS instead of using a local private shipping store which marks up the UPS shipping costs 40% to 60% which is the practice for these stores in order to stay in business.

I'll the take best earliest cash offer in the above $ range by end of today, Saturday, 11/22/97 12:00 Midnite E.S.T.

Thank you for reading this.

I need help on tm-251e from Kenwood.

I know that it has the function of UHF->VHF transponder and VHF digital repeater (with his digital recording section).

How can I do this modify? The only thing that I know is that I must work on diodes in the control unit, but which?

I will be very grateful to anyone that can help me... possibly with a sharp description of the "hardware work", expecially WHERE is the component I must work on.

Sorry for my english (I am Italian), thanks a lot.

Not your common boat anchor military HF radio! This ITT/Mackay MSR-8000 is only a few years old, and uses new digital technology! LED digital frequency and mode readout. Solid as a brick house, with passive backplane modular design. Separate boards for each function (i.e. power regulator, crystal oscillator, RF power amp, etc.) Will do 200 watts out if adjusted to do so, right now it's set for 125. Cabinet is sealed against the weather, and all circuit boards are poured-sealed with clear varnish. Manufactured by ITT/Mackay, and mine includes the hand mike a spare mike connector, and the service manual (not the useless "owners" manual. Modes: AM/DSB/LSB/USB/AM/FSK. Uses 12VDC for power. Matching remote autotuners and remote-mount control heads are available from Murphy's Surplus Sales. Frequency coverage on this unit is from 1.6-30 MHz, no gaps. These units sell on the surplus market for $1200 and up plus shipping. I'll take $1150 for mine shipped CONUS. There is only one minor defect in mine, and that is that the on/off relay is bypassed. When the power supply is switched on- the radio is on. This part is available is someone wanted to fix it. 73 all, DE Web, KR4WM in Myrtle Beach, SC

Hi Yin,

This is the info you asked for as follows:
Pin 1 - Ground
Pin 2 - Power Direct (connect to pin 3 for remote AC power switching)
Pin 3 - AC Power common
Pin 4 - +13.8 VDC to control DC module
Pin 5 - No connection
Pin 6 - Power Switching
Pin 7 - 12.6 VAC (or 13.8 VDC) to heaters "filaments"
Pin 8 - 13.8 VDC to pin 9 in AC operation
Pin 9 - 13.8 VDC to operate solid state circuits
Pin 10 12.6 VAC to pin 7 in AC operation
Pin 11 - +13.8 VDC to DC Module
Pin 12 - +13.8 VDC to DC Module

Connection for AC operation
Pin 1 - No connection
Pin 2 - No connection
Pin 3 - 120 VAC
Pin 4 - No connection
Pin 5 - No connection
Pin 6 - 120 VAC
Pin 7 - Jumper to 10
Pin 8 - Jumper to 9
Pin 9 - Jumper to 8
Pin 10 - Jumper to 7
Pin 11 - No conneciton
Pin 12 - No connection

Connection for DC operation
Pin 1 - Negative 13.8 VDC
Pin 2 - Jumper to 4,7,9,11, and 12
Pin 3 - No connection
Pin 4 - Jumper to 2,7,9,11, and 12
Pin 5 - No connection

Pin 6 - Positive 13.8 VDC
Pin 7 - Jumper to 2,4,9,11, and 12
Pin 8 - No conneciton
Pin 9 - Jumper to 2,4,7,11, and 12
Pin 10 - No connecition
Pin 11 - Jumper to 2,4,7,9, and 12
Pin 12 - Jumper to 2,4,7,9, and 12

Double check the logic of all this because I typed it word for word from the manual and nothing is harder to find than your own mistakes.

Good Luck '73

Roger KA4LDN

Use your mic gain to adjust the speech processor. I used a SM-5 desk
mic, it's gain adjust set at 10:00, the 730 mic gain set to 9:00 and
always with the speech processor turned on. I always received
comments on excellent audio

No..what I said was correct. These are PCS phones that have the
ability to fall back to cellular in a non-covered area. They are not
Cellular phones as Cellular is known.
PCS is not the same as cellular.

It depends on what you're going to use to measure the voltage. An
oscilloscope probably won't be sensitive enough. Some (not many)
spectrum analyzers might be. the manual is pretty clear. They
recommend an RF millivoltmeter or another receiver. Follow the directions
explicitly. You're going to be down in the low mV range.

Message-ID: <rbarris-ya02328000231197152535000 1@206.82.216.1>
Source record: 161157

I have a couple new 7.2V 2200 mAh batteries for my Yaesu FT-530 HT.
These are the FNB-26(S) form factor.

I also have two drop-in chargers, a "MasterCharger" which is said to be
intelligent about charging NiCd and NiMH cells, and a Yaesu NC-42 drop-in
charger.

The NC-42 is the one I am curious about. It has two lights on it for
"quick charge" and "trickle charge" modes, and on the underside it says
"Input 100-120/200-240VAC, Output 7.2V / 1.1A DC"

My question is: is the NC-42 safe to use with the NiMH packs?

(I charged one of my two new batteries with it already, it seems to work
OK but not knowing more about the NC-42 I am a little shy about popping my
other new battery into it right away).

Even if you don't know about the Yaesu unit specifically, are there some
rules of thumb for determining charger/battery compatibility?

Hello,
I have for sale the Yaesu FT-50R 5 watt HT. This also has been modified for out of band transmission. It includes the following. All in excellent condition with boxes and receipts. Little over one year old.

CA-14....charging sleeves (2)
NC-50....Quick charger;dual slot
CSC-68.Soft case
CSC-69.Soft case
FNB-40..650ma 6V battery
FTT-12...Keypad

This radio is the 5Watt version. So your will have 2 batteries...

No marks or scratches on anything....excellent condition...Paid little over $600....asking $500....or best offer.

73's, Art

If you go to the Yaesu Japan Web site you will see a section called 'NEW PRODUCTS". Go there. Then whenyou see the FT-847 site check ALL THE ATTACHED PAGES. You will see there is an OPTIONAL ANTENNA TUNER.
Also there is an OPTIONAL SSB FILTER (unknown width). and a OPTIONAL CW filter(500HZ).
Both filters appear to be at the 8.8 MHZ bandwith which makes me think the radio is DOUBLE CONVERSION.
These are my observations. Go check for yourself.

I am interested in hearing how those of you have grounded your rig when operating in portable mode. Specicially, I am not always able to bring an 8ft ground rod with me when I operate portable and/or may not be able to "easily" drive and retrieve an 8ft ground rod.

How have your addressed this problem?

3715. Re: Yaesu FT-847

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-23 00:00:00 UTC
From: Felix <hershman@ix.netcom.com>
Message-ID: <3478E8B6.61DB78A4@ix.netcom.com>
Source record: 161169

Also, the price of the FT-847 is 210,000 YEN or about $1700-$1800 USA.
The FT-920 list price is 198,000 Yen and that costs about $1750 and with the
current $100 coupon promotion it is $1650 from many Dealers in the USA.
I hope I am wrong about the ANTENNA TUNER being an option for this radio.
I think they said it is the FC-20 no price. The optional filters should cost
about $120 each. My guess is the SSB narrow filter is 2.0 khz at the 8.8 MHZ
IF stage.
The 500 hz CW filter option should cost the same and is in the same IF.
Depending on the price of the OPTIONAL TUNER I may decide to buy the ICOM
IC-746. I heard from several reliable sources the radio will cost under $1600.
Perhaps
$100 or so more at the beginning bet should come down in price like every
other radio
after 6 months (plus bugs worked out!) The IC-746 has a built in Scope like
the IC-756
and also has 100 WATTS out on two meters. No 440 MHZ on this radio. But tuner

is built in and the radio is TRIPLE CONVERSION.
Steve

Hello,

Regarding Hand Held PC

To all interested parties, can you please contact my friend who wanted this posted. I tried to do him a favor by letting him use my PC, but I think it's best that you reply directly to his e-mail address, at his home.

I'm overwhelmed with questions (in my mailbox) I can't answer! This was a post as a favor for a friend on the local ham repeater.

He can be reached at MMQV37B@Prodigy.com

Much appreciated if you can direct all questions to him as he's the owner..

I GOT IT!! First thing I did was wrap 3 wraps of tin foil around the distributer. Noise on 6m went from S9 to about S3... I can live with that :) And the truck was running at about 2500 rpm! There were a few holes so I added more foil pieces. Noise went from S3 back to S9, don't know why but they didn't last. Next, I cut a jam can in half and soldered the two pieces to make a short cylinder and put that over the dist. (removing the tin foil), then put tin foil over the top where the wires enter. 6 meters was cured! A single wrap of foil won't work, I tried that before..

Now on to 80m. Still S9 or better. I removed my old ground to the radiator and threw it away.. Had a look and like a dummy last year didn't remove the paint where the ground attached. Gotta remember it was December and really cold.. Got the wire wheel on the drill and removed the paint (ah duhh...) Then I got some braid from RG8 and used that to ground from the rad to the antenna to the block and to the frame. 80 meters and 40 meters were so quite I thought my antenna was broken :)

Oh yea, I put a 22,000 uF capacitor with a 14amp fuse on the alternator. That helped a bit.

Remove _NOSPAM to E-mail reply.

The following was (stolen, lifted, copied) from the RT systems site.
They are the makers of the ADMS software.
Thanks RT Systems

Alan
KA2PVR

Lost data in VX-1 CPU for Squelch & S meter functions
Reprogramming Procedure:
Note: ** in procedure below repsents any number sequence
Press & hold the VOL + FW + MON buttons down together and power up the
radio. The Display should now show HSSQ03 (note: the important 3 is the
small 3 at the top of the display. If anything but 3 appears at the top
of
the display, press the BAND button until the 3 appears)
Press the UP button to display HASQ**
Turn the dial until the display shows HASQ08
Press the UP button to display THSQ**
Turn the dial until the display shows THSQ4F
Press the UP button to display TISQ**
Turn the dial until the display shows TISQ2F
Press the UP button 2 times to display S1LV**
Turn the dial until the display shows S1LV34
Press the UP button to display S9LV**
Turn the dial until the display shows S9LVA3
Press the UP button to display HSSQ03
Press the BAND button 3 times until the display shows HSSQ06 (again
note:
this is the small 6 at the top of the display)
Press the UP button to display HASQ**
Turn the dial until the display shows HASQ08
Press the UP button to display THSQ**
Turn the dial until the display shows THSQ4D
Press the UP button to display TISQ**
Turn the dial until the display shows TISQ30
Press the UP button 2 times to display S1LV**
Turn the dial until the display shows S1LV27
Press the UP button to display S9LV**
Turn the dial until the display shows S9LV96
Press the FW button for 0.5 seconds to store these settings into memory.
The
radio will return to normal mode.
The reprogramming procedure is now complete.

PrimeCo just came out with a CDMA-AMPS dual mode phone. However, it does not have analog service everywhere that analog service is available. They have agreements in certain areas. It looks like they have no coverage, or future coverage planned, in many areas. St. Louis is one of those areas.

I had a 730 for a number of years. Good rig overall. Only two things to watch for -

1. The screws that hold the circuit boards down (and provide nessesary grounding) tend to loosen up. At any sign of intermittant problems, open it up and crank down all the screws.

2. It's sensitive to supply voltage, especially undervoltage. This will show up as warbled/distorted transmitted signal. Rig needs a good power supply and connections must be clean.

I ran mine mobile for almost 10 years with only the above 'problems' if you call it that. I miss it now, sold it a few years ago cause I needed the $$$.

WELL, that's sort of an oxymoron - who would buy programs or hardware for a computer that WOULDN'T run it?

But, like it or not, if you want to upgrade your software - as well as some hardware - you will HAVE to go to Windows 95 or it's successor, since all serious software developers are quite naturally going to write their stuff for the present and future platforms - NOT the past! SO, enjoy your present stuff, and get the most out of it, cuz yer probably locked into it for the rest of it's useful life...

Cellulars do not have this capability, but some of the better PCS
phones offer it, because their coverage is not complete yet.

(feeling the need to follow this with 10 lines of nonsense ....to make
me look as important as Masa)

Source record: 161249

Our local club needs the following for the Club UHF Micor Repeater:

TLE 1603B Tripler/Low Level Amplifier for UHF Micor Repeater Transmitter

- or -

It has the following transistors:

1 - M9690 cross to MRF 838A
1 - 9737 replaces by Motorola 488441152 cross to 2N5944
1 - 11l52 Motorola 488441152 cross to 2N5944 (same as above)

These parts are available from Motorola, but a little out of the club's price range. If someone had some surplus stuff collecting dust we would be interested.

Thanks and 73,
Joe

I noticed an odd effect when engaging the tone squelch with the noise
squelch open or carrier on the air, the squelch "pops" several times
before it closes. Really just an annoyance, doesnt happen otherwise.

Ed Cregger <ecregger@jaguarsystems.com> wrote:

From: asimonin@murdrum.nmsu.edu
Message-ID: <658jf4$2eh@bubba.NMSU.Edu>
Source record: 161252

I was confronted with the same problem last spring. Purchased a Yaesu FT51R with mobile DC adapter/charger for mobile use from Ham Radio Outlet (HRO) and a Valor Pro*Am dual band magnetic mount antenna for the car! Also purchased Premier AL-800 dual band high gain antenna so I could save on battery power while in the portable walk around mode. Built a 12 volt DC power supply for fixed base use, any reasonably regulated 3 to 4 amp supply should work... Lots of really great features on the FT51R. Really very happy with the radio and antenna arrangements --

73's and Good luck

3768. Re: More information on the FT847 ??

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-23 00:00:00 UTC
From: "Charles A. Rubenstein" <rubenc@iglou.com>
Message-ID: <01bcf829$3b259e80$3854aac7@rubenc.iglou.com>
Source record: 161274

I cant read Japanese, but I deciphered the following:

FT847 - HF 100W
6M 100W
144Mhz 50W
430Mhz 50W
Full duplex operation with sat tracking
DPS filter onboard

Size: 260mmW x 86mmH x 270mmD

Looked like price was 210,000 yen.

There were also listings for a FT847M with all bands at 50W, and a FT847S model with 10W on HF, 20W on 6M and 144/430.

I'll be buying one if they are comming to USA. Anyone looking for an IC-820H or IC-706?

The CB Guy wrote:

"Cellulars do not have this capability, but some of the better PCS phones offer it, because their coverage is not complete yet."

Excuse me...if the unit can operate on both an 800 MHz cellular system and a 1900 Mhz PCS system, seems to me that it *would* be a cellular phone (as well as a PCS phone).

Maybe you meant to say that *digital* cellular phones can't fall back to PCS?

(Have you heard about the latest cellular scam? Some carriers are offering lower rates for digital phones, so a few people apparently are altering the electronic serial numbers of cheap analog phones to match the format of digital cellular ESNs, then signing up for service at the lower digital rate.)

The 79A cannot do "memory lockout" but you can extend the tx & rx up to
510 mhz.

The 79AD will do the "memory lockout" for scanning but tx & rx up to
only 470 mhz.

Both 79A and 79A will do AM (aircraft freq) and FM, just following the
build-in instructions and do not expect to hear any FM radio station
boardcast after you do the mod because the 79A is NFM, not WFM receive.

ALl 79A and 79AD US models cannot do cell freq because they are made
after the deadline (2/1994 ??).

Cross-posted to:
rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.equipment

The Cherokee AH-100 SSB handheld makes a great little 10 meter sideband rig. The price just dropped to US$214. It comes with a mobile adapter (MA100) that replaces the battery pack. The MA100 has a single coiled cord that ends in an SO-239 and cig lighter plug. This turns it into an all-in-the-mic mobile rig.

7Watts PEP. AM/SSB. It's fun working "handheld DX" with it when the band is open, using a WTA-1 Maxon telescopic whip.

Has anyone done the simple 12 meter mod yet?

When will ICOM, Kenwood, Yaesu, or Alinco, etc, jump in, using their already-tooled cases and battery packs, to bring out a 20, 17, 15, 12, or 10 meter handheld?
They could just start with a 10m and/or 15m SSB/(FM)/CW unit; with the rising DX conditions and the increase in activity.
Next: How about an HF all band handheld? Companion antenna could provide filtering.

Are there any mods for the old Pro-42 scanner that Radio
Shack used to sell? I'm giving away my old one to a friend's son
for x-mas, and want to spiffy it up. I'm mostly looking for how
to remove the gaps it currently has to allow it to cover
everything between 30Mhz and 512Mhz, or at least add 66Mhz -
88Mhz to current freqs without loosing any. And, if it's possible
to increace the scan speed without sacrificing quality.
If anyone has any info on this, please e-mail me.

Remove the second, anti-spamming N from the
end of tdragon in my address to respond,
tdragonn@blarg.net

Use a balanced antenna and don't worry about RF grounding (still need
to maintain AC ground integrity for safety if running off AC). We've
run coax-fed dipoles in field day from the top of a mountain, where
it's impossible to drive a ground rod because the ground is so rocky.
No problems at all- no hot chassis, the auto antenna tuner works fine,
etc.

I don't agree. Vietnam was won by guerilla warfare. By the time the US left, the war was won. It's well known the US won every (or nearly so) major battle of the war but lost the war. This is because the U.S. could not or would not fight the guerilla war in the jungle. Furthermore, the VC won the psychological war, which is also part of guerilla warfare. Regardless of who was backing them, the VC or North Vietnamese won using guerilla warfare, not conventional techniques.

Also, the economic boycott of South Africa was not universal. It was not the only reason for the change of government.

Hello All;
I am selling the Kenwood PS-50 power supply. It has less then
five hours of use. I'm the 2nd owner. Both of us are nonsmokers.
Asking $150+shipping. PS-50 with cover & original carton. No CODs
Reason for selling is strictly financial. Please re:me via through
Packet: N2RIF@WM2f.#SNJ.NJ.USA.NA
Or Better
Email: n2rif@amsat.org
My phone# is: (609) 386-9382 but sorry it is busy most of the time.
You can try though anytime from 10am to 10pm ET..
Thank you for reading my sale's bulletin.
de Thomas J or Just T.j. -73
P.S. The power connector will fit all Kenwood and almost all
HF & vhf/uhf allmode Icom Radios.

3810. New Yaesu FT-847 - Price

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-24 00:00:00 UTC
From: morel.GRunberg@telrad.co.IL
Message-ID: <FA90C2154736D111AD5300805F927C42013545@mismail.mis.elex.co.il>
Source record: 161068

On the Yaesu-Japan home page there are three
FT-847 variants: 847, 847M and 847S. I think that
the U.S. and European model is FT-847 and his
list price is given at Y210000 (abt $1700 ?).

Transceiver type

Range FT-847 847M 847S

1.8-30MHz 100W 50W 10W
50MHz 100W 50W 20W
144/430MHz 50W 50W 20W

It's interesting if this new transceiver is suitable for satellite
work too.

Ground rods are primarily for lightning protection since RF penetrates only a
few
inches below the surface. Just stay QRX when near thunderstorms and you will
do fine.

I would guess that it has Yaesu proprietary code programmed
into it, if it's really the CPU (which sounds reasonable with
a Motorola part number of MC 146805G (a 6805, it would seem).

Because the code is likely proprietary, if Yaesu can't/won't
supply a replacement, I would sadly say he's probably SOL.

Will Yaesu repair the unit if it is returned for service
(as opposed to shipping a CPU chip for customer installation)???
It may be that they don't want to deal with the yahoos who would
botch the installation job ruining both the chip and the PCB with
bad soldering technique/lack of proper tools, then try to return
the chip as defective and file a warranty claim on the radio.

From: hillgen@bigfoot.com
Message-ID: <3478cc28.2929536@news.cris.com>
Source record: 161090

Hi,
I have a bit of a dilemma. I inadvertantly programmed my VHF
(146-162) Saber III with a codeplug of the wrong bandsplit (136-150.8)
and now theres' a little problem. The radio's display reads
"ERR 0 81"
when it's powered up and none of the functions seem to work. I can
successfully read the radio and I seem to be able to write the radio,
but nothing has any effect. The radio is an H43SAK7139CN however it
thinks it's an H43QXK7139CN.
Can anyone help? How do I get it to think it's healthy???!?! :)
Any thoughts appreciated!
Thanks,
Jay

This is a neat little FM transceiver, but I now have two for 2m and only need one, and need cash for HF needs!
25 and 5 watts switchable, 142-149.995 mHz coverage, programmable digital display, memories, scanning, offsets, tone, detachable face plate, included 8 pin mic plug with pigtail permits lots of remote mic controls, manual, other information I have gathered.
Azden has authorized service sites (I have that info).
Asking $135. plus shipping.

I was serious about the relationship between PCS and microwave ovens.
I wouldn't think it would be safe to use PCS for a long time although
the PCS's power is very low.

do you have any ideas of power used in the microwave + power used in
the PCS ??

thanks

Source record: 161103

I am new to computers and was wondering if RF can do any damage. I run a SB-220 and am asking if anything needs to be done to RF proof the computer. I am running Windows 95 with a HP scanner and Canon printer. The computer is not in the shack but one leg of the 40 Mtr Inv Vee runs directly overhead.

3833. ICOM 706 MK II mods

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-24 00:00:00 UTC
From: samten@cam.org
Message-ID: <34793910.5913485@nntp.hip.cam.org>
Source record: 161104

I've seen many mods for the original version of this radio, can anyone
tell me if the MK-II can be modified to transmit(AM modulation) in
the 108-136 (aircraft) VHF range, and in the case that it cannot, is
it now at least a decent receiver in that particular range?
Thanks,
Guy VE2AFM

>How have your addressed this problem?

I run QRP from batteries so safety isn't an issue. And I generally use
dipole-type antennas. So there's no necessity to "ground" the rig and I
don't make any attempt to do so.

Depends on how you define successful. It has been sucessful in our lifetime
in Vietnam, Afghanistan and South Africa. In general, it is far less bloody
than traditional warfare because it does not confront the enemy head on
with massed troops. As far as it being ugly, what type of warfare isn't?

2.45 GHz has no special properties which make it particularly effective at heating flesh. It just happens to be a ISM band where it is convienent to generate power in a cavity of a size useful for home cooking. It heats by ordinary dielectric heating. Microwave ovens typically range from 600 watts to 1000 watts. PCS runs a maximum of 0.6 watt.

There is some slight concern about localized heating to sensitive tissues in the head, primarily the eyes, but this is almost 10 db less than the power used by amateur HTs, and over 30 db less than is used by microwave ovens. If you persistently stuck the PCS antenna against your eyeball, there might be some concern, but otherwise it isn't a significant hazard.

Actually, Vietnam wasn't won by guerrilla warfare. 20 years of VC activity
led to virtually no gains. It was the introduction of NVA regulars backed by
massive Soviet aid which ultimately won that war after the US abandoned
the South Vietnamese. And in Afghanistan, it was again massive outside
aid (this time from the US, channeled through Pakistan) which turned the
tide against the Soviet occupation forces, though at least in that case the
combatants did use guerrilla tactics right up to the end, so I'll grant half
credit for that one. The situation in South Africa was not resolved by guerrilla
warfare at all. It was resolved by a global economic boycott.

There are a few examples of genuine guerrilla warfare victories. Castro's
conquest of Cuba is one. But most guerrilla wars wind up as stalemates at
best, and outright losses at worst. For example, look at the guerrilla movements
in Latin America today. Virtually all of them are merely nuisances, and
governments continue to change the old fashioned way, by military coup. In
Africa, the situation is similar, with most guerrilla movements achieving at
best a stalemate with the government forces of whatever dictator happens
to be in power at the moment.

If victory is to be achieved, a guerrilla movement generally must convert
itself to a popular people's army at some point and convert to conventional
military tactics to destroy its opponent by main force. That's usually very
difficult to do without massive outside military aid. What nation is going
to aid the radio pirates against the US government?

I doubt there is any danger of *damage*, but it is certainly possible to cause
it to misbehave with that much RF floating around. The usual cures for
computer RFI also work to prevent RF ingress, and will stop such problems.

The first microwave ovens in the 1950s operated at 915 MHz,
and were big, bulky, institutional-size brutes - as you might
imagine, when you consider the size of 915 MHz waveguide and
cavities. Home microwave ovens didn't become practical until
they moved to 2.45 GHz, with the attendant smaller cavities
and plumbing.

>rod.

Hey Bert,

I'm not sure why you want to ground it, but here's what I do:
I use a 4 ft rod, which is easily driven in with a small mall (about 2
pounds) and it comes out very easily if you twist it back and forth a
bit first (vise grips are handy). However, I do this only for a
modicum of lightning protection, because I use dipoles with a balun,
and I see no need for a ground for purposes of getting a good signal
into the air. If you are using a vertical, then you've got a much
bigger problem than you've let on to, so far - like what do you do for
radials?

>is not in the shack but one leg of the 40 Mtr Inv Vee runs directly
>overhead.

Hi Bruce,
I believe this is a rare problem, but it's worth knowing about.

I purchased two keyboards that were described as Windows95 keyboards.
They have two special keys that you use that are equivalent to mousing
the Start button and equivalent to a right click.

When I operate with a level of power and with an antenna that produces
high levels of RF in the house, I find that any computer that is up
and running with one of those keyboards goes beserk. The result is
that files get deleted, renamed, etc. It's as if you let a monkey run
amok at the keyboard.

The problem seems to be independent of which side of the power line
the PC is plugged into and independent of where in the house the PC is
located.

I have not attempted any shielding or other measures to correct the
problem, because I found that I rarely use hi-power, the close in
antenna and those PC's all at the same time.

Wrong, The maximum power of the 1900 Mhz CDMA PCS phones is 200 mW, not 600 mW. 600 mW is the maximum power for the handheld analog cell phones. The ATT Digital PCS phones are 600 mW, but that is in a different frequency range than the range on discusion here.

A member of my ham club said his Yaesu FT-2400 was powered on overnight and the car battery died. When he replaced the battery, the FT-2400 turns on with every feature of the display turned on. He cannot get it to function normally in any respect. Does anyone know of a way to reset the cpu on this rig? Please reply by email.

3860. Re: SPAM from ADI Communications

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-24 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <97112412283620917@atdbbs.com>
Source record: 161131

This is an interesting scenario...sorry I missed the original posts, but I will look 'em up asap.

The concept on online ethics should be addressed. Similar discussions take place around my dinner table occasionally, where we toss similar-but-different ideas back and forth and ask each other how we would respond to each.

The recent "spam" from Ken at Premier/ADI is intriguing. His source for the mailing addresses was Amateur Radio operators who have participated in online discussion groups. That is a VERY well-defined category, indeed. And Ken seems to have performed his homework in this regard. I mean, all of his recipients were Amateurs who ALREADY have an online presence.

So - step back and think for a moment. Ken has contributed MANY articles on MANY subjects to the Amateur community the past two years. QST, PopComm, The REACTer, CQ-VHF, and other national and international magazines have printed his articles and reviews and commentaries on our hobby. Ken even has a Proposed Rule Making in the works for public service associations with the FCC.

Would ANY AMATEUR on Ken's recent "hit list" object to receiving, say, a Draft Copy of an upcoming article proposal he has in the works? Probably not. THAT type of "spam" would be quite welcome by the majority of targeted recipients.

And this is where the commercial nature of Ken's spam comes into play.

I love first-hand accounts of hands-on experiences with equipment. Equipment that I may purchase...or that which covers the bands I'm licensed for. Or test equipment...or scanners. (Hey - I receive Bob Parnass' EXCELLENT posts on Scanners here 6-10 times a year... wouldn't bug me a bit if I were receiving them via email - they are pertinent, detailed, and important pieces.)

What I am trying to get at is this: if Ken were a fly-by-night firm, with a piece of crap HT breaking, though, the $200. price point - and spamming the world, he should be castrated and strung up to dry.

But that is not the case in the least. Ken represents a firm that has established itself very quickly as one with excellent products, receptive/responsive customer service, and (most important to many) a very attractive retail price.

So let's look at what Ken did -not- do. He didn't get a job with ADI - a new firm to us - and immediately put his name on a piece of untargeted spam touting the virtues of his wares.

(Believe me - it's much easier to "spam the world" than to methodically research your intended audience. It costs more, too, to the originator.)

No - Ken's been with ADI for a while now, and by all appearances, ADI is here to stay. Major reviewers have positive things to say about ADI. Dealers can't keep ADI HTs adequately stocked at times due to our demand for them. And we, the consumers, love 'em.

So what has Ken really done? He advised licensed Amateur Radio operators who already have a Web presence that ADI offers good equipment at good prices. And he asks them to please bookmark a web site for more information.

Geeze, people --- you cannot even PURCHASE anything on that web site - it's purely informational in nature.

That's it. Don't reply to me with, "All spamming is bad." If you are on the Internet, you are already bombarded with solicitations for phone and Web sex, diet and health products, and moneymaking scemes by the scores. THAT'S where our legislative efforts should be directed. NOT to well-directed, pertinent, newsworthy, targeted advertisements to appropriate audiences.

Hi Gary,
> What nation is going
>to aid the radio pirates against the US government?
It's called people power.
You should of seen the way that the CB issue was fought and won here in the UK during the late 70's, early 80's. We're talking a march past westminster and our houses of parliament.
I believe a similar battle was won in spain when the radio authority's were considering doing away with SSB privaleges on 11m.
From what I've read on the ng's, the shit will hit the fan sometime in the not too distant in the US regarding the microcasters and others in the free radio movement.
Surely you agree that you can only push people so far.
Interference is hogwash, free radio operators would I'm sure gladly pay for pro quality tx's if they were not going to be busted.
I know commercial licenced broadcasters here in the UK whose spectral quality leaves something to be desired!

Thanks for listening.

Actually, they are Alinco units.
The range is limited-but for LOCAL repeaters, or LOCAL simplex, they are
useable.
Note that some users have reported problems with the antenna mount.

Subject: RF and my computer

I am running a Yaesu Ft 101 into a dipole that runs right over my office.
For computers I have an HP 7320 pentium, a Toshiba laptop 486/75 and for
packet an old junker 486/25, all withing 10 feet of the radio and not more
than 20 feet from one end of the dipole. The old junker doesn't even have
the top on it anymore. I note that there is absolutley no impact to any of
this hardware. My only thought would be to have a good RF ground and see
what happens. I might add that I have more troubles with RF interference
on my telephone than anything else...

Bill, Matt,
I had the same problem on an AT&T 900 MHz phone. I took the keypad apart
and cleaned the conductive metal on the board with a pencil erase on
alcoho and put it back together. Works like new...for now. The rubber
pads were not worn on this unit however. Good luck

From: annen@execpc.com
Subject: Rubber Keypad problems

I have an Icom IC-2GXAT ht. About 6 months ago a few of the most used
buttons stopped working. I cracked open the radio, and after some
testing came to the conclusion that the conductive pads underneath the
rubber keypad had worn down. I called Icom and ordered another keypad.
Well, now six months later, the same problem. Has anyone else had this
problem with the keypad on their radio? I am looking for solutions to
this problem, other than having to order another pad from Icom every 6
months. An ideal solution would be to get a hold of the compound they
use on the bottom of the pad. MCM sells the stuff, but at $25 a pop, you
would think it had gold in it. Furthermore, the manufacturer of the gunk
says it will cover 200 or more buttons, but they fail to clarify that it
all has to be mixed at once (shameful for only 1 or two buttons). Anyone
who has fixed this kind of problem please let me know. Thank You Matt
Annen

Subject: Help! Best Way To Measure Doublet With MFJ-259?

On 24 Nov 1997 17:25:26 GMT, "DavidC" <davidc@bit-net.com> wrote:

>I have recently acquired a MFJ-259 Analyzer.
>I have a doublet antenna (200 feet per side fed with 450 line).
>What is the best way to look at this antenna using the MFJ-259?

Hello David,

I have always understood a doublet to mean a resonant dipole.(I could be wrong - I've been wrong on a lot of things lately). I have always referred to a non-resonant dipole fed with ladder line as a Center Fed Zepp.

All of that notwithstanding, the problem that you imply is that you have an unbalanced instrument to be connected to a balanced line. My solution to that has been to connect the MFJ-259 directly to the balanced line. I know this isn't kosher. However, it seems to work. Here's my criteria for that, and I may have just been lucky. I carefully built a 1:1 current Balun and checked it for the frequency range of interest to make sure it was acting like a balun should. Then I used it with the MFJ-259 to make my measurements on the CF Zepp. They agreed very well. I then substituted a piece of coax wound on an 8" form, that was approx. 1/4 wave on the frequency of interest. That makes a good balun. Again my measurements indicated that I could just use the MFJ-259 without any balun and get the same results. I really doubt that this procedure would work that well for higher frequencies - i.e., frequencies above 18 MHz.

Since you are about to find out that the impedance at the transmitter/tuner end of your antenna/feedline system is not what you would hope for, please do yourself a favor and check out:

http://people.delphi.com/cecilmoore/mystery.htm
Which is titled "W6RCA's No-Tuner, All-HF-Band,
Horizontal, Center-Fed Antenna".

From: "Clinton Peebles" <cpeebles_NOSPAM_@nel.auracom.com>
Subject: HF Noise in Toyota

I GOT IT!! First thing I did was wrap 3 wraps of tin foil around the
distributer. Noise on 6m went from S9 to about S3... I can live with that
:) And the truck was running at about 2500 rpm! There were a few holes so
I added more foil pieces. Noise went from S3 back to S9, don't know why but
they didn't last. Next, I cut a jam can in half and soldered the two pieces
to make a short cylinder and put that over the dist. (removing the tin
foil), then put tin foil over the top where the wires enter. 6 meters was
cured! A single wrap of foil won't work, I tried that before..

Now on to 80m. Still S9 or better. I removed my old ground to the radiator and threw it away.. Had a look and like a dummy last year didn't remove the paint where the ground attached. Gotta remember it was December and really cold.. Got the wire wheel on the drill and removed the paint (ah duhh...) Then I got some braid from RG8 and used that to ground from the rad to the antenna to the block and to the frame. 80 meters and 40 meters were so quite I thought my antenna was broken :)

Oh yea, I put a 22,000 uF capacitor with a 14amp fuse on the alternator. That helped a bit.

Remove _NOSPAM to E-mail reply.

The best mod to expand frequencies in the IC-27A is to buy a transceiver that does the coverage you want. The 27A/H were designed and built when ham radios were just that, Ham Radios. No expanded coverage, no public service scanner, just ham radio. Thats what made them great. They had bullet proof front ends. When I ran my 27H mobile I never experienced the intermod I run into with my w i d e new dual band transceivers.

I suggest the ARRL's Radio Amateurs Handbook, the RSGB Handbook, and the
Editors & Engineers Radio Handbook.

You might be able to get application notes from tube manufacterers for
specific tubes. Like the 3-500Z the 3CX800, etc....

A temporary fix is to coat the backside of the rubber buttons with
thinned rubber cement, then pour finely-ground carbon (you can use
ground-up pencil lead too) or locksmith's graphite over them.

When the rubber cement cures, you hopefully have enough conductive material ahering to and imbedded with the rubber cement to substitute for the deposited conductive material that used to be there.

Alternatively, you can make your own "conductive coating" by mixing these ingredients ahead of time then applying them only to the areas that need it.

It works, but depending on the quality of the job, it may not work for a long period of time. Quality of materials and workmanship will ultimately determine the time factor.

Subject: TM-V7A Software Info

Friends,

I got this from Kenwood today when I inquired about their EZ-Clone software for the TM-V7A:

Dear Kenwood Customer:

Thank you for your e-mail. Kenwood has worked with a company called Applied Computing Systems to develop and produce the EZ-Clone Software for the TM-V7A. Unfortunately, this product has never readily become available for sale. Applied Computing Systems has decided not to continue the development of this project and will not distribute or support EZ-Clone software nor will they sell it in the future to the Amateur community.

We would like to apologize to our customers for this unfortunate and unforeseen end to this project. Kenwood is committed to producing programming software for the TM-V7A as well as other current Kenwood models. We anticipate that by the spring of 1998, we will have software available for your TM-V7A that you will be able to download from our FTP site. This software will be a genuine Kenwood Product not after market.

Thank you for your patience and understanding.

Sincerely,

Kenwood Customer Care

Despite Kenwood's claims above, some dealers still have the software and cable in stock if you want to call around. R&L Electronics in Hamilton, OH is one that does.

The Radio Shack amateur transceivers are traditionally not modifiable by
design.

This has been true since the very first piece of RS amateur gear. Many Hams
do
not believe this and buy them to find that they can not be modified. What you
got
is what you got. It is my understanding that since they can not be modified,
their performance is really pretty good.

If I remember right, the new dual band hand held announced earlier this years
was
able to be modified and RS yanked it.

73, Bob

Subject: Wanted: Hallicrafters SX-43 manual/schematic/etc

Looking for documentation on Hallicrafters SX-43 receiver:
owner's manual, schematic, service info, Sams Photofact,
whatever I can get. Bought one of these sets at auction
last night as-is, with no documentation.

I'm sure I could get the manual from W7FG or HI Manuals,
but I'd like to try the less-expensive way first.

Will pay REASONABLE copying and postage costs (I specify
reasonable here because in the past, I've had folks offer
to copy 5-page manuals for me for a mere $20, etc).

I tried one for SSB from a ham friend. The $200 soupon looked appealing. The DSP for
CW is good but for SSB it sounds awful.

Source record: 160941

Thanks for setting me straight! So I guess the Icom 746 at 198,000 Yen will be even less!!

Also, I have more CONFIRMED INFO on the FT-847.
The radio DOES NOT have a built in TUNER . There is an OPTIONAL TUNER model FC-20. There are two OPTIONAL filters for the 455khz IF.
500 HZ filter and a 2.75 KHZ Collins Mechanical Filter.

If you go to the following site you can confirm this.
http://www.martin-lynch.co.uk/
Anyways, the radio still looks interesting even though it doesn't have the built in tuner.
I don't have a price for the FC-20 BUT I HAVE A PRICE FOR THE FC-10 Tuner for the FT-840 $380 !! That will bring the price for the radio and the tuner to $2000.
I may elect to buy the IC-746 for $1600 an give up the 440 MHZ band.

Actually, they are Alinco units.
The range is limited-but for LOCAL repeaters, or LOCAL simplex, they are
useable.
Note that some users have reported problems with the antenna mount.

I've got a 27 MHz HT you can have for $10.

If you want a specific band, you might disclose that fact.

Subject: RF and my computer

I am running a Yaesu Ft 101 into a dipole that runs right over my office. For computers I have an HP 7320 pentium, a Toshiba laptop 486/75 and for packet an old junker 486/25, all withing 10 feet of the radio and not more

than 20 feet from one end of the dipole. The old junker doesn't even have
the top on it anymore. I note that there is absolutley no impact to any of
this hardware. My only thought would be to have a good RF ground and see
what happens. I might add that I have more troubles with RF interference
on my telephone than anything else...

Bill, Matt,
I had the same problem on an AT&T 900 MHz phone. I took the keypad apart
and cleaned the conductive metal on the board with a pencil erase on
alcoho and put it back together. Works like new...for now. The rubber
pads were not worn on this unit however. Good luck

From: annen@execpc.com
Subject: Rubber Keypad problems

I have an Icom IC-2GXAT ht. About 6 months ago a few of the most used buttons stopped working. I cracked open the radio, and after some testing came to the conclusion that the conductive pads underneath the rubber keypad had worn down. I called Icom and ordered another keypad. Well, now six months later, the same problem. Has anyone else had this problem with the keypad on their radio? I am looking for solutions to this problem, other than having to order another pad from Icom every 6 months. An ideal solution would be to get a hold of the compound they use on the bottom of the pad. MCM sells the stuff, but at $25 a pop, you would think it had gold in it. Furthermore, the manufacturer of the gunk says it will cover 200 or more buttons, but they fail to clarify that it all has to be mixed at once (shameful for only 1 or two buttons). Anyone who has fixed this kind of problem please let me know. Thank You Matt Annen

Subject: Help! Best Way To Measure Doublet With MFJ-259?

On 24 Nov 1997 17:25:26 GMT, "DavidC" <davidc@bit-net.com> wrote:

>I have recently acquired a MFJ-259 Analyzer.
>I have a doublet antenna (200 feet per side fed with 450 line).
>What is the best way to look at this antenna using the MFJ-259?

Hello David,

I have always understood a doublet to mean a resonant dipole.(I could be wrong - I've been wrong on a lot of things lately). I have always referred to a non-resonant dipole fed with ladder line as a Center Fed Zepp.

All of that notwithstanding, the problem that you imply is that you have an unbalanced instrument to be connected to a balanced line. My solution to that has been to connect the MFJ-259 directly to the balanced line. I know this isn't kosher. However, it seems to work. Here's my criteria for that, and I may have just been lucky. I carefully built a 1:1 current Balun and checked it for the frequency range of interest to make sure it was acting like a balun should. Then I used it with the MFJ-259 to make my measurements on the CF Zepp. They agreed very well. I then substituted a piece of coax wound on an 8" form, that was approx. 1/4 wave on the frequency of interest. That makes a good balun. Again my measurements indicated that I could just use the MFJ-259 without any balun and get the same results. I really doubt that this procedure would work that well for higher

frequencies - i.e., frequencies above 18 MHz.

Since you are about to find out that the impedance at the
transmitter/tuner end of your antenna/feedline system is not what you
would hope for, please do yourself a favor and check out:

From: "Clinton Peebles" <cpeebles_NOSPAM_@nel.auracom.com>
Subject: HF Noise in Toyota

I GOT IT!! First thing I did was wrap 3 wraps of tin foil around the distributer. Noise on 6m went from S9 to about S3... I can live with that :) And the truck was running at about 2500 rpm! There were a few holes so I added more foil pieces. Noise went from S3 back to S9, don't know why but they didn't last. Next, I cut a jam can in half and soldered the two pieces to make a short cylinder and put that over the dist. (removing the tin foil), then put tin foil over the top where the wires enter. 6 meters was cured! A single wrap of foil won't work, I tried that before..

Now on to 80m. Still S9 or better. I removed my old ground to the radiator and threw it away.. Had a look and like a dummy last year didn't remove the paint where the ground attached. Gotta remember it was December and really cold.. Got the wire wheel on the drill and removed the paint (ah duhh...) Then I got some braid from RG8 and used that to ground from the rad to the antenna to the block and to the frame. 80 meters and 40 meters were so quite I thought my antenna was broken :)

Oh yea, I put a 22,000 uF capacitor with a 14amp fuse on the alternator. That helped a bit.

Remove _NOSPAM to E-mail reply.

The best mod to expand frequencies in the IC-27A is to buy a transceiver that does the coverage you want. The 27A/H were designed and built when ham radios were just that, Ham Radios. No expanded coverage, no public service scanner, just ham radio. Thats what made them great. They had bullet proof front ends. When I ran my 27H mobile I never experienced the intermod I run into with my w i d e new dual band transceivers.

I suggest the ARRL's Radio Amateurs Handbook, the RSGB Handbook, and the Editors & Engineers Radio Handbook.

You might be able to get application notes from tube manufacterers for specific tubes. Like the 3-500Z the 3CX800, etc....

A temporary fix is to coat the backside of the rubber buttons with thinned rubber cement, then pour finely-ground carbon (you can use ground-up pencil lead too) or locksmith's graphite over them.

When the rubber cement cures, you hopefully have enough conductive material ahering to and imbedded with the rubber cement to substitute for the deposited conductive material that used to be there.

Alternatively, you can make your own "conductive coating" by mixing these ingredients ahead of time then applying them only to the areas that need it.

It works, but depending on the quality of the job, it may not work for a long period of time. Quality of materials and workmanship will ultimately determine the time factor.

Subject: TM-V7A Software Info

Friends,

I got this from Kenwood today when I inquired about their EZ-Clone software for the TM-V7A:

Dear Kenwood Customer:

Thank you for your e-mail. Kenwood has worked with a company called Applied Computing Systems to develop and produce the EZ-Clone Software for the TM-V7A. Unfortunately, this product has never readily become available for sale. Applied Computing Systems has decided not to continue the development of this project and will not distribute or support EZ-Clone software nor will they sell it in the future to the Amateur community.

We would like to apologize to our customers for this unfortunate and unforeseen end to this project. Kenwood is committed to producing programming software for the TM-V7A as well as other current Kenwood models. We anticipate that by the spring of 1998, we will have software available for your TM-V7A that you will be able to download from our FTP site. This software will be a genuine Kenwood Product not after market.

Thank you for your patience and understanding.

Sincerely,

Kenwood Customer Care

Despite Kenwood's claims above, some dealers still have the software and cable in stock if you want to call around. R&L Electronics in Hamilton, OH is one that does.

The Radio Shack amateur transceivers are traditionally not modifiable by
design.

This has been true since the very first piece of RS amateur gear. Many Hams
do
not believe this and buy them to find that they can not be modified. What you
got
is what you got. It is my understanding that since they can not be modified,
their performance is really pretty good.

If I remember right, the new dual band hand held announced earlier this years
was
able to be modified and RS yanked it.

Try going back to the old antenna. The least that can happen is that
your previous performance will return. You may also discover something
in the process of going back and forth, that would explain the
differences.

Don't forget, the scientific method demands changing only one thing at
a time.

Subject: Selling OUt New List

Thanks to everyone who has purchased. New list.
MFJ Super DSP Filter $80
Kenwood PS50 Power Supply $175
Drake TR 33 C 2 Meter $55
Kenwood Sp430 Speaker $55
Kenwood MC 85 Mic $85
Vibroplex Paddles $75
Daiwa SWR Power Meter 1.8 to 150 Mg $65
Belle and Howell Scope $50
CS401 Daiws 4 way antenna switch $35
Tower 45 ft large bottom sections $275 in OHIO
New Sound Blaster CD Kit sound card speakers $85
MFJ 941 E tuner $80
Trac Keyer $15 Mint shape but electrical problems.
Yaesu handheld Mic $25
Icom Hand Mic $ 30
Ten Tec Mic $30
D 104 $50
Shure 444D $25
12 volt 2 amp supplies $10 (New)
PK 232 MX $50
Halicrafters SX 71 $115

Collection of tubes $50 for all of them (alot of good finals)
Service Manuals....
Regular Manuals....
Old Test equipment.
If interested let me know.
Thanks,
Kevin

FYI, folks. You can convert many currencies to most other currencies
at the following web site:

http://www.xe.net/currency/

This requires a forms-capable browser but provides currency conversion
for about 70 types of monetary units.

BTW, 210,000.00 JPY (Japanese Yen) is equivalent to
1,653.81 USD (American Dollars).

73 all!

3874. KYOKUTO FM-2015R Help

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-25 00:00:00 UTC
From: Don Smith <desmith@innercite.com>
Message-ID: <347BBC58.4143F3C@innercite.com>
Source record: 160946
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

I have just obtained a Kyokuto Denshi Model FM-2015R 2-meter mobile radio that has problems. I have the Operators Instruction but it doesn't have much in troubleshooting information. The unit seems to have problems with the readout and PLL circuit. There is audio and squelch control working but no tx (tx lite works). Has anybody had experience with this model? Or where could I get it repaired reasonably? Don Smith KB6GQA.

3875. Standard 766's Who had them?

Try www.yaesu.co.uk, they have it up there, I don't recall that it had a built in tuner, but man, after the 920, I am NOT impressed... ok, 6,2 and 440 are nice, but man this thing is an ugly radio! The 920 is a work of art (and I don't own one), this sucker is piggy lookin'! And here's another one, if this radio is supposed to replace the 900, why no detachable faceplate and no Auto-tuner? (those things are almost mandatory in HF mobile now). Also, I'll put money that Yaesu has got the DSP in the AF stage and not in the IF stage, where it should be. Now don't get me wrong, I am not saying its not a good bargain, it absolutely is, but Yaesu seemed to be going somewhere with the "sleek look" radios like the 920, 8100, etc. This thing has an industrial look to it. Not bad, but not in keeping with the other new Yaesus. Also, this appears to be aimed right smack at the Amsat groupies... all mode 144/440.. say goodbye to the 736! That's my 2cents... I hope this rig is made to replace the 840 and 736, and not the 900, because if it is, its my opinion that Yaesu just LEFT the HF mobile arena.

Pete -- KA2YDY

>Quebec, Canada.

The morse test in Canada is slightly different from the states.

First, we have both receiving and transmitting test.

For receiving, you must write down what you hear. If you make 5
mistakes or more, you don't pass the exam.

For transmitting, you can make mistakes, but you must correct your
mistakes. If you don't realize your mistake or go on without
correcting your mistake, you don't pass the exam.

As far as the multiple choice type of quesitons (US) are concerned,
the morse test in Canada is more strict.

3888. FT-847 PRICE !!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-25 00:00:00 UTC
From: Felix <hershman@ix.netcom.com>
Message-ID: <347A5D81.AAAEEA48@ix.netcom.com>
Source record: 160990

Got it ! The Yaesu Japan lists the FT-847 for 210,000 Yen, The FT-920
for 198,000 YEN. So the FT-847 will cost a bit more than the FT-920. In
the USA the best price for
a FT-920 is $1730 plus a $100 coupon from Yaesu USA. That brings the
price to $1630. I won't mention the Dealer but he is in QST Magazine.
So Figure on spending
about $1800 iniatialy and then seeing the price go down to $1700 USA
dollars plus any
coupons 6 months or so into the sale of the radio.

3889. IC-746 PRICE !!!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-25 00:00:00 UTC
From: Felix <hershman@ix.netcom.com>
Message-ID: <347A5E87.1234F828@ix.netcom.com>
Source record: 160991

Got it! Went to the ICom Japan site and saw the IC-746 costs 198,000 Yen. So figure the radio will costs about $1700 inititally and then drop to $1600 after 6 months. This radio should cost a bit less than the New FT-847 Radio. For comparison , the IC-756
first came out at 256,000 Yen and then the price dropped sharply. In the USA the price
was $2300 USA Dollars and I have seen the Radio advertise for as low as 1875 at two Dealers. Obviously the IC-746 will have to cost less so there you go.
Steve NS1R

3890. FT-847 Built in Tuner?????

Actually, there's a lot of countries who hate the US. Iran and Iraq for example. China would probably be willing to pitch in. And then there are the transnational munitions makers who would love to profit from a US civil war. If the people are to be sucessful in the upcoming civil war, we need to recruit outside help, I agree, even from people we may not like all that much (Saddam Hussein). Biochem weapons tilt the balance in our

favor, unless the govt is willing to use nukes to obliterate the American people.

Try cleaning both the pads and the PCB with rubbing alchohol. This
usually works quite well.

>I have recently acquired a MFJ-259 Analyzer.
>I have a doublet antenna (200 feet per side fed with 450 line).
>What is the best way to look at this antenna using the MFJ-259?

Hello David,

I have always understood a doublet to mean a resonant dipole.(I could be wrong - I've been wrong on a lot of things lately). I have always referred to a non-resonant dipole fed with ladder line as a Center Fed Zepp.

All of that notwithstanding, the problem that you imply is that you have an unbalanced instrument to be connected to a balanced line. My solution to that has been to connect the MFJ-259 directly to the balanced line. I know this isn't kosher. However, it seems to work. Here's my criteria for that, and I may have just been lucky. I carefully built a 1:1 current Balun and checked it for the frequency range of interest to make sure it was acting like a balun should. Then I used it with the MFJ-259 to make my measurements on the CF Zepp. They agreed very well. I then substituted a piece of coax wound on an 8" form, that was approx. 1/4 wave on the frequency of interest. That makes a good balun. Again my measurements indicated that I could just use the MFJ-259 without any balun and get the same results. I really doubt that this procedure would work that well for higher frequencies - i.e., frequencies above 18 MHz.

Since you are about to find out that the impedance at the transmitter/tuner end of your antenna/feedline system is not what you would hope for, please do yourself a favor and check out:

Looking for documentation on Hallicrafters SX-43 receiver:
owner's manual, schematic, service info, Sams Photofact,
whatever I can get. Bought one of these sets at auction
last night as-is, with no documentation.

I'm sure I could get the manual from W7FG or HI Manuals,
but I'd like to try the less-expensive way first.

Will pay REASONABLE copying and postage costs (I specify
reasonable here because in the past, I've had folks offer
to copy 5-page manuals for me for a mere $20, etc).

> please let me know.

Ah, yes, the old Fox Peter Mike. I had two of em' at one time. The BIG
bummer about this radio is the cogged rubber belt on the bandswitch.
When the teeth strip off or the belt breaks breaks, you are SOL unless
very determined. The rubber deteriorates, hardens and cracks over time.
They still make belts like these, used in printers sometimes. I found
some new belts but not the right length. I had to cut and splice them
with wire, not easy. Try not to change bands.
Otherwise it works okay except for lotsa backlash in the main tuning.
This was Hallicrafters last gasp at the ham market, I believe. An attempt
to create a cheaper radio for a declining market (incentive licensing?).
Its a hybrid, all discrete transistor except for the driver and sweep tube
final with PI network. It also had a dual power supply built in with a
transistorized inverter for 12VDC operation.
Now an orphan radio. I could not find parts, sorry.

Good luck,
Jim K7YO

Hi guys, as u know, I'm looking for an HT1000 or GP300 VHF 16ch. radio! Have been watching the posts, and am ready to buy. I've noticed a lot of GP300's going in pairs, this would be nice as well. Will offer $300 for good HT1000/batt/rpd. chrgr. and roughly same for pair of GP300's in good shape. will also offer partial trade of items previously posted by me! Prefer newer models 'c' or so (ht)... Please email and let me know what u have and we'll talk. remember to remove the spam filter as listed below when replying!
thanks!

> TRA #5213
> KN6PL

Traditionally, this is accomplished by mirroring the antenna element
as a counterpoise or ground plane. A true ground rod is not even
required, although it is good practice for DC/AC grounding of generators,
to prevent electrical shock to ground where generators are used.

I use a military screw ground rod (a 24 inch thing that literally screws
into the ground to provide a large surface area for ground contact),
when operating portable, and that works fine. A 4 foot ratshack ground
rod will work fine. A long screwdriver will also effectively work when
the ground is relatively moist.

The important point is to think about what your power source is, what
your antenna is, and how to coordinate them. For example, if you are
using a dipole fed with a half wave line, then a ground is not even
required, in battery operation (always ground in generator operation).
If you are working an end fed wire against a ground, use a counterpoise
to provide the ground, and a small grounding rod of some sort if you are
not on battery power. If the operating position is at a point where
a high RF potential is likely to exist, ground it and/or use a counterpoise.
Size your counterposises, accordingly, and whether or not you are at a high
or a low rf energy point (relatively a 1/2 or a 1/4 wave counterpoise).
If the operating position is at a low RF potential point, you theoretically
don't need to ground, but it is probably wise to do so anyway. If you are
using generators, always ground.

If you use a hard-to-remove ground rod of some sort, carry an old-timey
auto jack with you, and a couple of vise-grip pliers to provide a point
to jack the rod out with. Vise-grip on the pliers and jack the rod out.
A chain will often work, in lieu of vise-grips.

All of this pertains to portable operation only. Always ground at any fixed station location. Always ground where generators are used, since they can pick up considerable static charge if ungrounded, on any exposed metal parts. It also cuts line noise if generators are grounded. Ground at the generator and at the operating position.

Good Luck and be safe.

>VC won the psychological war, which is also part of guerilla warfare.
>Regardless of who was backing them, the VC or North Vietnamese won using
>guerilla warfare, not conventional techniques.

You are wrong. After Tet, there wasn't enough of a VC force left alive to pose a credible threat to anyone. Tet ended the VC as a fighting force. It was the greatest US military victory of the war. After that point, only NVA regulars were capable of fielding an effective force. And after we moved into Cambodia, they ceased to be able to get that force into the field in South Vietnam. (We'd already stopped them at the DMZ.)

At that point, the countryside was effectively pacified, and the US started the "Vietnamization" of the war, IE bugging out on our allies. But when the US withdrew, the North was able to pour regular troops over the border, and the ARVN were unable to stop them. The fall of Siagon had NVA battle tanks closing on the city, and NVAF aircraft gaining dominance in the air. It was a standard conventional war. And the North had more troops, more espirit, and massive Soviet arms aid to equip them. (We ceased even supplying arms to the ARVN when we pulled out.) The fall of South Vietnam was definitely *not* a guerrilla war.

Of course you are correct that the war was actually lost on the US domestic political front. When the US withdrew, it was inevitable that the NVA regulars would be able to roll over the unsupported and unsupplied ARVN. (They effectively lost most of their artillery, armor, and air support when we cut and run.)

The VC were never a decisive factor in the war militarily. It was exploitation of their *image* that helped turn public opinion at home, IE the myth that they were everywhere, and that we were unable to contain them. Tet was used politically to claim we couldn't deal with the VC when in fact it proved just the opposite. We virtually wiped them out. Yet domestically Tet was seen as a defeat rather than the great victory which it was.

>Also, the economic boycott of South Africa was not universal. It was
>not the only reason for the change of government.

Name another factor which threatened to crush the South African government. It certainly wasn't guerrillas on the border. That problem was well in hand.

>The US colonists did not destroy the British by main force yet they >still won. Although, you did say generally. ;-)

The American Revolution was a sideshow to a bigger global conflict between European powers. If it weren't for the material aid of France, and the tying down of the main part of British combat power in other arenas, the colonists wouldn't have gained a victory. And Washington's army *was* an army in the traditional sense. It was not a guerrilla force. It *did* fight conventional battles, and did obtain the surrender of Cornwallis by conventional force of arms (and the threat of a French fleet appearing at his rear).

There were some guerrilla type actions in the Revolutionary War, particularly in the South and on the western frontier, but they didn't decide the outcome. The Continental Army may not have had the pretty red uniforms of the British, but it was an army, and fought as a conventional army. (Though the Americans had enough sense to make use of available cover while the Brits used the traditional massed volley of the "thin red line". But that's just a matter of tactics, and doesn't mean the Continental Army was a guerrilla force.)

This is *completely* off topic. If you want to continue it, take it to a military history newsgroup.

> Since when has an MCX-100 been worth $150?
I've sold a lot for $100. Great radios.

>Sellers can hardly give them away at the local ham swaps.
Send them to me. Please.

> Difficult to impossible to have programmed
> (how many hams have ready access to an R-1800 programmer?),
Actually quite easy and you sure don't need an R-1800.

> uses a 1-time PROM (82S129, 131, etc.)
Under $2 at Jameco.

>limited number of channels, etc.
32 is plenty for my purposes, and they all will do it!

Incidently, the same programmer which will program
MCX-100's will also program the Syntor, which also
is worth $100-$150.

For details, come see me. 73 P N7OCS pbennett@macnet.com

```

You heard right...
Available from TechAmerica (RS affiliate), low power (350 mW, I think) 2m or
70cm ht's. Run on Alkaline AA batts, no NiCad pack listed for them. Can't
find my sale flyer right now, but I think they were Icoms.
$88.00
Use would be limited with the low power out, but interesting anyhow.

Actually, they are Alinco units.
The range is limited-but for LOCAL repeaters, or LOCAL simplex, they are
useable.
Note that some users have reported problems with the antenna mount.

Subject: RF and my computer

I am running a Yaesu Ft 101 into a dipole that runs right over my office. For computers I have an HP 7320 pentium, a Toshiba laptop 486/75 and for packet an old junker 486/25, all withing 10 feet of the radio and not more

than 20 feet from one end of the dipole. The old junker doesn't even have the top on it anymore. I note that there is absolutley no impact to any of this hardware. My only thought would be to have a good RF ground and see what happens. I might add that I have more troubles with RF interference on my telephone than anything else...

Bill, Matt,
I had the same problem on an AT&T 900 MHz phone. I took the keypad apart and cleaned the conductive metal on the board with a pencil erase on alcoho and put it back together. Works like new...for now. The rubber pads were not worn on this unit however. Good luck

From: annen@execpc.com
Subject: Rubber Keypad problems

I have an Icom IC-2GXAT ht. About 6 months ago a few of the most used buttons stopped working. I cracked open the radio, and after some testing came to the conclusion that the conductive pads underneath the rubber keypad had worn down. I called Icom and ordered another keypad. Well, now six months later, the same problem. Has anyone else had this problem with the keypad on their radio? I am looking for solutions to this problem, other than having to order another pad from Icom every 6 months. An ideal solution would be to get a hold of the compound they use on the bottom of the pad. MCM sells the stuff, but at $25 a pop, you would think it had gold in it. Furthermore, the manufacturer of the gunk says it will cover 200 or more buttons, but they fail to clarify that it all has to be mixed at once (shameful for only 1 or two buttons). Anyone who has fixed this kind of problem please let me know. Thank You Matt Annen

A temporary fix is to coat the backside of the rubber buttons with
thinned rubber cement, then pour finely-ground carbon (you can use
ground-up pencil lead too) or locksmith's graphite over them.

When the rubber cement cures, you hopefully have enough conductive
material ahering to and imbedded with the rubber cement to substitute
for the deposited conductive material that used to be there.

Alternatively, you can make your own "conductive coating" by mixing
these ingredients ahead of time then applying them only to the areas
that need it.

It works, but depending on the quality of the job, it may not work for
a long period of time. Quality of materials and workmanship will
ultimately determine the time factor.

Steve

3930. TM-V7A Software Info

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-25 00:00:00 UTC
From: Mitchell Hamm <mitch@xpalmtop.net>
Message-ID: <347B694D.6E81C7CC@xpalmtop.net>
Source record: 161032

Friends,

I got this from Kenwood today when I inquired about their EZ-Clone
software for the TM-V7A:

Dear Kenwood Customer:

Thank you for your e-mail. Kenwood has worked with a company called
Applied Computing Systems to develop and produce the EZ-Clone Software
for the TM-V7A. Unfortunately, this product has never readily become
available for sale. Applied Computing Systems has decided not to
continue the development of this project and will not distribute or
support EZ-Clone software nor will they sell it in the future to the
Amateur community.

We would like to apologize to our customers for this unfortunate and
unforeseen end to this project. Kenwood is committed to producing
programming software for the TM-V7A as well as other current Kenwood
models. We anticipate that by the spring of 1998, we will have software
available for your TM-V7A that you will be able to download from our FTP
site. This software will be a genuine Kenwood Product not after
market.

Thank you for your patience and understanding.

Sincerely,

Kenwood Customer Care

Despite Kenwood's claims above, some dealers still have the software and
cable in stock if you want to call around. R&L Electronics in Hamilton,
OH is one that does.

Subject: ? $88 handhelds available?

You heard right...
Available from TechAmerica (RS affiliate), low power (350 mW, I think) 2m or
70cm ht's. Run on Alkaline AA batts, no NiCad pack listed for them. Can't
find my sale flyer right now, but I think they were Icoms.
$88.00
Use would be limited with the low power out, but interesting anyhow.

nospam.pcuellar@bright.net

Actually, they are Alinco units.
The range is limited-but for LOCAL repeaters, or LOCAL simplex, they are
useable.
Note that some users have reported problems with the antenna mount.

Subject: RF and my computer

I am running a Yaesu Ft 101 into a dipole that runs right over my office. For computers I have an HP 7320 pentium, a Toshiba laptop 486/75 and for packet an old junker 486/25, all withing 10 feet of the radio and not more than 20 feet from one end of the dipole. The old junker doesn't even have the top on it anymore. I note that there is absolutley no impact to any of this hardware. My only thought would be to have a good RF ground and see what happens. I might add that I have more troubles with RF interference on my telephone than anything else...

Bill, Matt,
I had the same problem on an AT&T 900 MHz phone. I took the keypad apart
and cleaned the conductive metal on the board with a pencil erase on
alcoho and put it back together. Works like new...for now. The rubber
pads were not worn on this unit however. Good luck

From: annen@execpc.com
Subject: Rubber Keypad problems

I have an Icom IC-2GXAT ht. About 6 months ago a few of the most used
buttons stopped working. I cracked open the radio, and after some
testing came to the conclusion that the conductive pads underneath the
rubber keypad had worn down. I called Icom and ordered another keypad.
Well, now six months later, the same problem. Has anyone else had this
problem with the keypad on their radio? I am looking for solutions to
this problem, other than having to order another pad from Icom every 6
months. An ideal solution would be to get a hold of the compound they
use on the bottom of the pad. MCM sells the stuff, but at $25 a pop, you
would think it had gold in it. Furthermore, the manufacturer of the gunk
says it will cover 200 or more buttons, but they fail to clarify that it
all has to be mixed at once (shameful for only 1 or two buttons). Anyone
who has fixed this kind of problem please let me know. Thank You Matt
Annen

Hello David,

I have always understood a doublet to mean a resonant dipole.(I could
be wrong - I've been wrong on a lot of things lately). I have always
referred to a non-resonant dipole fed with ladder line as a Center Fed
Zepp.

All of that notwithstanding, the problem that you imply is that you
have an unbalanced instrument to be connected to a balanced line. My
solution to that has been to connect the MFJ-259 directly to the
balanced line. I know this isn't kosher. However, it seems to work.
Here's my criteria for that, and I may have just been lucky. I
carefully built a 1:1 current Balun and checked it for the frequency
range of interest to make sure it was acting like a balun should.
Then I used it with the MFJ-259 to make my measurements on the CF
Zepp. They agreed very well. I then substituted a piece of coax wound

on an 8" form, that was approx. 1/4 wave on the frequency of interest. That makes a good balun. Again my measurements indicated that I could just use the MFJ-259 without any balun and get the same results. I really doubt that this procedure would work that well for higher frequencies - i.e., frequencies above 18 MHz.

Since you are about to find out that the impedance at the transmitter/tuner end of your antenna/feedline system is not what you would hope for, please do yourself a favor and check out:

http://people.delphi.com/cecilmoore/mystery.htm
Which is titled "W6RCA's No-Tuner, All-HF-Band, Horizontal, Center-Fed Antenna".

If you would like to get a running copy of some additional software that is useful for working your way around a Smith Chart you might also check my Web site:

Matt, have same problem with two different remote controls. The buttons still work (sometimes) but it requires a lot more pressure to get it to "take". And with a new remote costing $80 and up, it's is really a bum deal. If you come up with a solution, please post it here.

Thanks and good luck,

Bill

Source record: 161081

I am running a Yaesu Ft 101 into a dipole that runs right over my office. For computers I have an HP 7320 pentium, a Toshiba laptop 486/75 and for packet an old junker 486/25, all withing 10 feet of the radio and not more than 20 feet from one end of the dipole. The old junker doesn't even have the top on it anymore. I note that there is absolutley no impact to any of this hardware. My only thought would be to have a good RF ground and see what happens. I might add that I have more troubles with RF interference on my telephone than anything else...

I use random wires when I operate portable and a good ground is essential. I generally try to find the building ground or use the cold water pipe in the bathroom. An easily carried, telescoping six or eight foot ground rod for portable operation might not be such a bad idea. Someone ought to design and market it.

3955. Re: Bicycle Antenna Ideas?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-26 00:00:00 UTC
From: Dave Glenn <dglenn@connect3.com>
Message-ID: <01bcfa84$2a802700$4226c7cf@daveglenn.connect3.com>
Source record: 160890

Due to the lack of a ground plane I would suggest a J-Pole antenna with an HT. Wire a handlebar mounted Push to Talk switch. Vox on a bike doesn't work well due to wind noise keying the HT.

From: n8kjt@juno.COM (Norbert J Friedrich)
Subject: Deep cycle batteries vs. power supplies

I have used deep cycle batteries with a power supply to charge them for years now
with good results. I started with 375 AH floor scrubber batteries and they ran my 4 port packet BBS for 6 years till they started giving me trouble. My packet setup uses
70+ amps when all ports are xmitting the same time (it does happen), and there is
power to spare.
I have just replaced these batteries with a pair of 6V golf car batteries from Sears. They are reasonably priced (about $50 ea). My local Sears them ondisplay but had to order them for me.
Keep in mind, they do emit hydrogen gas, particularly if they are overcharged. My shack has plenty of air leaks so ventilation has not been a problem.

> ths topic. Anyone out there know???? Steve NS1R

Try www.yaesu.co.uk, they have it up there, I don't recall that it had a built in tuner, but man, after the 920, I am NOT impressed... ok, 6,2 and 440 are nice, but man this thing is an ugly radio! The 920 is a work of art (and I don't own one), this sucker is piggy lookin'! And here's another one, if this radio is supposed to replace the 900, why no detachable faceplate and no Auto-tuner? (those things are almost mandatory in HF mobile now). Also, I'll put money that Yaesu has got the DSP in the AF stage and not in the IF stage, where it should be. Now don't get me wrong, I am not saying its not a good bargain, it absolutely is, but Yaesu seemed to be going somewhere with the "sleek look" radios like the 920, 8100, etc. This thing has an industrial look to it. Not bad, but not in keeping with the other new Yaesus. Also, this appears to be aimed right smack at the Amsat groupies... all mode 144/440.. say goodbye to the 736! That's my 2cents... I hope this rig is made to replace the 840 and 736, and not the 900, because if it is, its my opinion that Yaesu just LEFT the HF mobile arena.

Pete -- KA2YDY

Subject: ? $88 handhelds available?

You heard right...
Available from TechAmerica (RS affiliate), low power (350 mW, I think) 2m or
70cm ht's. Run on Alkaline AA batts, no NiCad pack listed for them. Can't
find my sale flyer right now, but I think they were Icoms.
$88.00
Use would be limited with the low power out, but interesting anyhow.

nospam.pcuellar@bright.net

Actually, they are Alinco units.
The range is limited-but for LOCAL repeaters, or LOCAL simplex, they are
useable.
Note that some users have reported problems with the antenna mount.

Subject: RF and my computer

I am running a Yaesu Ft 101 into a dipole that runs right over my office.
For computers I have an HP 7320 pentium, a Toshiba laptop 486/75 and for
packet an old junker 486/25, all withing 10 feet of the radio and not more
than 20 feet from one end of the dipole. The old junker doesn't even have
the top on it anymore. I note that there is absolutley no impact to any of
this hardware. My only thought would be to have a good RF ground and see
what happens. I might add that I have more troubles with RF interference
on my telephone than anything else...

Bill, Matt,
I had the same problem on an AT&T 900 MHz phone. I took the keypad apart
and cleaned the conductive metal on the board with a pencil erase on
alcoho and put it back together. Works like new...for now. The rubber
pads were not worn on this unit however. Good luck

From: annen@execpc.com
Subject: Rubber Keypad problems

I have an Icom IC-2GXAT ht. About 6 months ago a few of the most used
buttons stopped working. I cracked open the radio, and after some
testing came to the conclusion that the conductive pads underneath the
rubber keypad had worn down. I called Icom and ordered another keypad.
Well, now six months later, the same problem. Has anyone else had this
problem with the keypad on their radio? I am looking for solutions to
this problem, other than having to order another pad from Icom every 6
months. An ideal solution would be to get a hold of the compound they
use on the bottom of the pad. MCM sells the stuff, but at $25 a pop, you
would think it had gold in it. Furthermore, the manufacturer of the gunk
says it will cover 200 or more buttons, but they fail to clarify that it
all has to be mixed at once (shameful for only 1 or two buttons). Anyone
who has fixed this kind of problem please let me know. Thank You Matt
Annen

Subject: Help! Best Way To Measure Doublet With MFJ-259?

On 24 Nov 1997 17:25:26 GMT, "DavidC" <davidc@bit-net.com> wrote:

>I have recently acquired a MFJ-259 Analyzer.
>I have a doublet antenna (200 feet per side fed with 450 line).
>What is the best way to look at this antenna using the MFJ-259?

Hello David,

I have always understood a doublet to mean a resonant dipole.(I could be wrong - I've been wrong on a lot of things lately). I have always referred to a non-resonant dipole fed with ladder line as a Center Fed Zepp.

All of that notwithstanding, the problem that you imply is that you have an unbalanced instrument to be connected to a balanced line. My solution to that has been to connect the MFJ-259 directly to the balanced line. I know this isn't kosher. However, it seems to work. Here's my criteria for that, and I may have just been lucky. I carefully built a 1:1 current Balun and checked it for the frequency range of interest to make sure it was acting like a balun should. Then I used it with the MFJ-259 to make my measurements on the CF Zepp. They agreed very well. I then substituted a piece of coax wound on an 8" form, that was approx. 1/4 wave on the frequency of interest. That makes a good balun. Again my measurements indicated that I could just use the MFJ-259 without any balun and get the same results. I really doubt that this procedure would work that well for higher frequencies - i.e., frequencies above 18 MHz.

Since you are about to find out that the impedance at the transmitter/tuner end of your antenna/feedline system is not what you would hope for, please do yourself a favor and check out:

http://people.delphi.com/cecilmoore/mystery.htm
Which is titled "W6RCA's No-Tuner, All-HF-Band,
Horizontal, Center-Fed Antenna".

From: "Clinton Peebles" <cpeebles_NOSPAM_@nel.auracom.com>
Subject: HF Noise in Toyota

I GOT IT!! First thing I did was wrap 3 wraps of tin foil around the
distributer. Noise on 6m went from S9 to about S3... I can live with that
:) And the truck was running at about 2500 rpm! There were a few holes so
I added more foil pieces. Noise went from S3 back to S9, don't know why but
they didn't last. Next, I cut a jam can in half and soldered the two pieces
to make a short cylinder and put that over the dist. (removing the tin
foil), then put tin foil over the top where the wires enter. 6 meters was
cured! A single wrap of foil won't work, I tried that before..

Now on to 80m. Still S9 or better. I removed my old ground to the radiator and threw it away.. Had a look and like a dummy last year didn't remove the paint where the ground attached. Gotta remember it was December and really cold.. Got the wire wheel on the drill and removed the paint (ah duhh...) Then I got some braid from RG8 and used that to ground from the rad to the antenna to the block and to the frame. 80 meters and 40 meters were so quite I thought my antenna was broken :)

Oh yea, I put a 22,000 uF capacitor with a 14amp fuse on the alternator. That helped a bit.

The best mod to expand frequencies in the IC-27A is to buy a transceiver that does the coverage you want. The 27A/H were designed and built when ham radios were just that, Ham Radios. No expanded coverage, no public service scanner, just ham radio. Thats what made them great. They had bullet proof front ends. When I ran my 27H mobile I never experienced the intermod I run into with my w i d e new dual band transceivers.

I suggest the ARRL's Radio Amateurs Handbook, the RSGB Handbook, and the
Editors & Engineers Radio Handbook.

You might be able to get application notes from tube manufacterers for
specific tubes. Like the 3-500Z the 3CX800, etc....

>Thanks and good luck,

>Bill

A temporary fix is to coat the backside of the rubber buttons with
thinned rubber cement, then pour finely-ground carbon (you can use
ground-up pencil lead too) or locksmith's graphite over them.

When the rubber cement cures, you hopefully have enough conductive material ahering to and imbedded with the rubber cement to substitute for the deposited conductive material that used to be there.

Alternatively, you can make your own "conductive coating" by mixing these ingredients ahead of time then applying them only to the areas that need it.

It works, but depending on the quality of the job, it may not work for a long period of time. Quality of materials and workmanship will ultimately determine the time factor.

From: Mitchell Hamm <mitch@xpalmtop.net>
Subject: TM-V7A Software Info

Friends,

I got this from Kenwood today when I inquired about their EZ-Clone software for the TM-V7A:

Dear Kenwood Customer:

Thank you for your e-mail. Kenwood has worked with a company called Applied Computing Systems to develop and produce the EZ-Clone Software for the TM-V7A. Unfortunately, this product has never readily become available for sale. Applied Computing Systems has decided not to continue the development of this project and will not distribute or support EZ-Clone software nor will they sell it in the future to the Amateur community.

We would like to apologize to our customers for this unfortunate and unforeseen end to this project. Kenwood is committed to producing programming software for the TM-V7A as well as other current Kenwood models. We anticipate that by the spring of 1998, we will have software available for your TM-V7A that you will be able to download from our FTP site. This software will be a genuine Kenwood Product not after market.

Thank you for your patience and understanding.

Sincerely,

Kenwood Customer Care

Despite Kenwood's claims above, some dealers still have the software and cable in stock if you want to call around. R&L Electronics in Hamilton, OH is one that does.

The Radio Shack amateur transceivers are traditionally not modifiable by
design.

This has been true since the very first piece of RS amateur gear. Many Hams
do
not believe this and buy them to find that they can not be modified. What you
got
is what you got. It is my understanding that since they can not be modified,
their performance is really pretty good.

If I remember right, the new dual band hand held announced earlier this years
was
able to be modified and RS yanked it.

Try going back to the old antenna. The least that can happen is that
your previous performance will return. You may also discover something
in the process of going back and forth, that would explain the
differences.

Don't forget, the scientific method demands changing only one thing at
a time.

Subject: Yaesu FT-847

Thanks for setting me straight! So I guess the Icom 746 at 198,000 Yen will be
even less!!

Also, I have more CONFIRMED INFO on the FT-847.
The radio DOES NOT have a built in TUNER . There is an OPTIONAL TUNER
model FC-20. There are two OPTIONAL filters for the 455khz IF.
500 HZ filter and a 2.75 KHZ Collins Mechanical Filter.

If you go to the following site you can confirm this.
http://www.martin-lynch.co.uk/
Anyways, the radio still looks interesting even though it doesn't have the
built
in tuner.
I don't have a price for the FC-20 BUT I HAVE A PRICE FOR THE FC-10 Tuner
for the FT-840 $380 !! That will bring the price for the radio and the tuner
to
$2000.
I may elect to buy the IC-746 for $1600 an give up the 440 MHZ band.

It depends on what you're going to use to measure the voltage. An
oscilloscope probably won't be sensitive enough. Some (not many)
spectrum analyzers might be. the manual is pretty clear. They
recommend an RF millivoltmeter or another receiver. Follow the directions
explicitly. You're going to be down in the low mV range.

From: lcval1@mail.NETcon.NET.AU (Damien & Linda Vale)
Subject: IC-775DSP ALC?

Using an SM-20 base mike with an IC-775DSP. Is the ALC indication on this model's meter normally sluggish, or is it my unit? It seems that the meter is not as lively as with the Kenwood units I'm used to. A slight increase in the Mic Gain (or Drive when using compresion) results in pinning the meter at the maximum ALC point, which I have carefully avoided. However in a recent pileup when the DX station was having trouble hearing me, I increased the Drive slightly which pinned the ALC, but the station said "wow, you've really come up - nice signal", so maybe it is not that critical.

Hi again Pleun,
In the UK you can get a PW Meon transverter which can be configured for
either a 28MHz or a 144 MHz IF. It was originally produced as a
constructional article in 'Practical Wireless' magazine. You can still
buy the PCB from them and I believe that there are one or two companies
here which will sell the component kits if you need them. If you source
the components yourself, and they are all fairly easy to get hold of, I
expect it would cost around 30UKP to build; less if you have a good junk
box.
I have used the 28 MHz IF version for several years and it has served me
very well. Output is just one watt but it is simple to add a single
stage PA to take it to a more useful level.

73 Trev G3ZYY ...-.-
PS, I can send you a JPEG version of the circuit diagram if you wish,
(by e-mail) but it is an 820K file!

From: lcval1@mail.NETcon.NET.AU (Damien & Linda Vale)
Subject: IC-775DSP ALC?

Using an SM-20 base mike with an IC-775DSP. Is the ALC indication on this
model's meter normally sluggish, or is it my unit? It seems that the meter
is not as lively as with the Kenwood units I'm used to. A slight increase in
the Mic Gain (or Drive when using compresion) results in pinning the meter
at the maximum ALC point, which I have carefully avoided. However in a
recent pileup when the DX station was having trouble hearing me, I increased
the Drive slightly which pinned the ALC, but the station said "wow, you've
really come up - nice signal", so maybe it is not that critical.

Hello and thank you for reading this posting,I have an older Kenwood ts 180s,but I have not been able to locate any of the mod upgrades to give it the WARC bands.

From what I gather the band selector switch has 2 aux settings for 12/17m and at one time these ware available as a kit to install yourself.Im just wondering if any one may know a source for more info even if it's just the part number I need for this it would be a help.Kenwood is not much help as the radio is not a current issue The radio itself is in good shape,and I know I keed more than the WARC in it to bring it up to todays satndard of features..Thank you

3963. DC cable for Yaesu FT-50R ???

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-26 00:00:00 UTC
From: abtownes@hotmail.com
Message-ID: <880561008.4993@dejanews.com>
Source record: 160898

I would like to know whether the DC cable
Yaesu sells, with the cigar lighter plug,
is just 2 conductors straight through. That
is, is it that easy to build one myself? No
regulators or current limiting circuit?

I expect that it is, since their slow charger
wall pack delivers 15 volts dc to the same
connector on the FT-50RD.

Thanks for any information.

Al

3965. Icom IC2000H extended XMIT

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-26 00:00:00 UTC
From: killian@aztec.asu.edu
Message-ID: <65hk11$hh0@news.asu.edu>
Source record: 160900

I have just purchased an ICOM IC2000H for use in my boat. I was wondering if anyone knows how to open up the TX. My purpose is for emergency transmit on marine frequencies. I operate on lakes and don't have a constant need for a marine radio, therefore I really don't want to buy one. However, I did have and emergency once and I had a 2M HT with extended TX. I called for help on CH16. Worked out well.

Anyway, if anyone knows the mod, please EMAIL me.

Thanks
Mike Killian

3967. Motorola MaxTrac

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-26 00:00:00 UTC
From: John Gonzalez <radio3@idt.net>
Message-ID: <347C4FC3.657902D9@idt.net>
Source record: 160902
Cross-posted to: rec.radio.swap,rec.radio.commercial-lmr,rec.radio.amateur.swap,rec.radio.amateur.equipment

For all those with nothing better to do, but say that the radio is stolen let me inform you. The MaxTrac was purchased from a Motorola shop on a trade and the guy owed me a favor. The radio itself was built by that shop from NEW PARTS that were aquired when someone went out of business. $400 is not a bad price for a radio that has never been used except for programming. All of this considering that it is 32 Channels and you are getting a DTMF mic., a regular mic., an external speaker, mounting brackets, power cable, and programming cable. If you don't want the radio then fine don't buy it but don't hurt the reputation of an honest post. I posted the article once every few days just in case the server killed the message due to so many other posts in the news group. I f you got it 10 times then I appologise, but that means that you don't read the group offten. I am only trying to sell a radio that I am not using. I thought that this was the purpose of the group!!!

3970. Kenwood TM-V7A Program Scan bug

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-26 00:00:00 UTC
From: nungeste@sdd.hp.com
Message-ID: <65hlug$jmu@news.sdd.hp.com>
Source record: 160905

Late October I bought a Kenwood TM-V7A from Amateur Electronic Supply in Las Vegas, Nevada, serial number 90100350, that had the following bug with Program Scan (scanning from freq 1 to freq 2 with a certain step size, then repeat). When I talked to Kenwood Service they said (paraphrased) "we know about it, send it in for a free microprocessor upgrade". I did so, and now it works fine. Considering how long the TM-V7A has been in production, I'll bet there are a lot of radios out with this bug.

Background for those that don't own a TM-V7A: Program Scan is done by setting up special memory channels called L1, U1, L2, U2, L3, U3 (Lower and Upper freq, 3 non-overlapping sets, 6 such channels for VHF and 6 for UHF).

L1 to 145.120, U1 to 145.480, 20 kHz steps on both channels, and it works as expected.

L2 to 146.025, U2 to 147.990, 15 kHz steps on both channels, and the scan doesn't wrap back at 147.990 but instead keeps going up past 148 MHz.

L2 to 146.010, U2 to 147.990, 15 kHz steps on both channels, and the scan now wraps around, but from 147.990 to 146.015 (wrong) rather than to 146.010. It then continues up in 15 kHz steps from 146.015 (wrong).

Ditto, I agree. PS, I checked out the big picture on the UK page, and the radio does have a Tuner button on it, so there probably is one on board, of course, it could always just be a control button for an external tuner, but thats more of an Icom trick.
As for an FT-900 replacement, I'd like to see something with all the controls on the removable faceplate, IF-DSP (I know, dream on), and something a little tighter than the 2.75 Kc Collins Mech filter they arte shipping with.

3974. fs: Kenwood TS-430S w/mic

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-26 00:00:00 UTC
From: DavidC <davidc@bit-net.com>

Source record: 160909
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

I have a Kenwood TS-430S w/SSB & AM filters, Mic, Manual & original box
that I must sell. From a trade, but cannot keep for financial reasons.
100-watt HF transceiver in very good condition. The transceiver has a
general coverage (0 to 30 Mhz) receiver with 10 Hz frequency readout, and
is capable of transmission from 1.8 to 30 Mhz continuous. Has the standard
2.4 kHz SSB filter, plus the 6.0 Khz AM filter (great for
shortwave listening). Will accept a 270 Hz CW filter, and an FM board
(FM-430) which would enable and maximize all modes -- SSB, CW, AM, and FM.
Receiver features IF shift, noise blanker, and notch filter. Dual VFO's and
eight memory channels, with built-in memory and band scanner. A compact,
reliable, high-performance set in fully working condition that looks good.
This rig was completely checked out and adjusted by a Kenwood authorized
repair shop just 2 years ago. Asking $475. plus shipping.

That was sold by Kenwood as a complete kit. Called the 180 WARC Kit (how novel). I still see those ever so often at ham-fests etc.

For my money you would be ahead to sell the 180 and put the money to a 430-440. The kit is not the easiest thing to install although it does work. It takes me about 2-3 hours and I have done several.

There is some sort of electronics inside the cigar lighter plug. It might be a true voltage regulator, or just an electronic ripple/noise filter. But it does drop several volts across it, and there is a pass transistor and a heat sink in there. It isn't just a cable.

> > take advantage of more modes on Phase 3D.

I tend to think this new FT847 which is also shown in the new AES catalouge will be the end of the FT736R. They will probably sell out of existing inventory which may take a while. The FT847 has so much more to offer compared to the old technology FT736 at probably about the same price as a FT736R which only has 144/430-440, and if you want 6 meters the module only puts out ten watts. That does leave a question about contesters who need the 220/1200 all mode capabilty. Transverters will possibly be a solution. The FT847 will be well equipped to handle most if not all modes of P3D. 430mhz will be the uplink frequency of choice. 1200/2400 downlinks will be handled by having a downconverter/preamp to 144mhz right at the antenna. This will reduce line losses that would be horrendous at those frequencies even with short runs of quality coax. A major dissapointment to me is that it looks like the FT847 will not be able to monitor two bands at the same time like the Kenwood TS790 and the Icom IC821 do. It would be nice to be having a hf qso while also monitoring the 144.200 ssb calling frequency. It certainly looks like the best all-in-one rig to have come out to date though.

3987. HELP: Connect ICOM to Timewave DSP

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-26 00:00:00 UTC
From: Craig and Gloria Novak <craig_novak@abraxis.com>
Message-ID: <347C610E.7EE@abraxis.com>
Source record: 160922
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur

Thank you for reading this.

How have people hooked up an Icom to a Timewave DSP?

The very detailed DSP599 guide does not seem to give great direction so far as Icom transceivers are concerned. For one thing there is no direct PTT output like the manual seems to indicate.

I have heard that some HAMs have used the send output port (used to control a linear amplifier)on the ICOM and tied off the coax shield to the chassis ground.

Could someone provide guidance and hopefully I can hook up my Icom 736 to my new DSP599.

73 and Happy Thanksgiving

I too have used 12 volt gell cells as my primary station power supply... since about 1980. I still use the same home made 12 volt regulated supply to float the batteries at about 13.5 volts. I get about 5 or 6 years out of these fairly inexpensive batteries.

From: "Paul S." <pgs@northnet.org>
Message-ID: <347CAE2F.3AF0@northnet.org>
Source record: 160929

The Yaesu FT-50R has so far been a great radio for me. It offers so much. I beleive this radio must be selling very well and has been out for a few years or more. By now someone either OEM or aftermarket must be making a high performance antenna that uses the SMA jack. I'm looking to improve RX and TX. Is there anything?
Also I spent some time on the net and found two companies, Premier and Comet offer some antennas that screw into the SMA jack. Anyone have some experience with these? Thanx in advance
Happy Thanksgiving

From: Mike Morrow <mmorrow@companet.net>
Message-ID: <347CF00F.693F@companet.net>
Source record: 160931

Paul, I've used the FT-50 for about 18 months, and have bought three of them, actually. I was very disappointed with the out-of-ham-band sensitivity until I went to the Comet SMA-3 antenna. The performance change was amazing...repeaters on 173 mHz at my work site were only half scale with the original antenna, and inaudible a mile from work. With the SMA-3, I get good signals from these repeaters even at home 15 miles away.

The SMA-3 works well on 450, and 800 mHz too.

I've read on the internet a complaint that the antenna wasn't durable, but I own three that each have more than a year's worth of hard day to day use, and I've had no problems with any of mine.

The other complaint heard is that it is too long. It's about three inches longer than the original antenna, but much thinner and more flexible.

Another complaint heard is expense...they go for about $30. In my opinion, they are more than worth it!

I've also tried the Comet SMA-503 (a short thin flex-wire antenna) and not had nearly as good a result (signal wise).

I really like the Comet SMA-3, and recommend it highly!

Regards,
Mike / KK5F

Source record: 160933

I own both varieties of the Speed-X keys, and my favorite is the navy-style key (has a squared-off base) because the shaft of the key is made out of 1/4" bar stock, making for a VERY solid "feel". If you want to save a few bucks, you don't have to get the chrome version, but do get the navy knob (double knob) because you can then switch between conventional and Navy-style knobs using the parts that come with the key.

I have no experience with other keys, but I would recommend that you stay away from the Radio Shack variety because, for a little bit more money, you can get the "real thing".

Hope this helps. 73

The Radio Shack amateur transceivers are traditionally not modifiable by design.

This has been true since the very first piece of RS amateur gear. Many Hams do not believe this and buy them to find that they can not be modified. What you got is what you got. It is my understanding that since they can not be modified, their performance is really pretty good.

If I remember right, the new dual band hand held announced earlier this years was able to be modified and RS yanked it.

I suggest the ARRL's Radio Amateurs Handbook, the RSGB Handbook, and the
Editors & Engineers Radio Handbook.

You might be able to get application notes from tube manufacterers for
specific tubes. Like the 3-500Z the 3CX800, etc....

Gary,

I was wondering whilst reading whether someone was going to say
that, but I didn't think it would be you!

Don't be silly. Although you were getting into a bit of detail,
I wouldn't mind betting I wasn't the only one interested in your post.

Martin.

The best mod to expand frequencies in the IC-27A is to buy a transceiver that does the coverage you want. The 27A/H were designed and built when ham radios were just that, Ham Radios. No expanded coverage, no public service scanner, just ham radio. Thats what made them great. They had bullet proof front ends. When I ran my 27H mobile I never experienced the intermod I run into with my w i d e new dual band transceivers.

That's interesting. Australia has 80 CB channels. There are the 40 HF channels same as the US, and 40 UHF channels. What are the 80 UK frequencies?

It's a bit like Ford, GM, and Chrysler as far as manufactures are concerned. You will find devotees of each brand among hams. For what it's worth, a lot of people feel that the repair and warranty departments are best at Yaesu, Icom, and then Kenwood; from best to worst. Even some devisivness on that! 73 Steve AC6FR
P.S. I'm prone to Yaesu

Hello Rick,

It must be a design defect with this particular Make & Model. FYI,
it's called the "Turbo Plus" (no other hint as to mfr.) and the FCC
ID# is NQK BITS6001 - for whatever that's worth.

Try going back to the old antenna. The least that can happen is that
your previous performance will return. You may also discover something
in the process of going back and forth, that would explain the
differences.

Don't forget, the scientific method demands changing only one thing at
a time.

FYI, folks. You can convert many currencies to most other currencies
at the following web site:

http://www.xe.net/currency/

This requires a forms-capable browser but provides currency conversion
for about 70 types of monetary units.

BTW, 210,000.00 JPY (Japanese Yen) is equivalent to
1,653.81 USD (American Dollars).

73 all!

Actually, they are Alinco units.
The range is limited-but for LOCAL repeaters, or LOCAL simplex, they are
useable.
Note that some users have reported problems with the antenna mount.

Subject: FS:Kenwood PS-50 Power Supply

Hello All;
I am selling the Kenwood PS-50 power supply. It has less then
five hours of use. I'm the 2nd owner. Both of us are nonsmokers.
Asking $150+shipping. PS-50 with cover & original carton. No CODs
Reason for selling is strictly financial. Please re:me via through
Packet: N2RIF@WM2f.#SNJ.NJ.USA.NA
Or Better
Email: n2rif@amsat.org

My phone# is: (609) 386-9382 but sorry it is busy most of the time.
You can try though anytime from 10am to 10pm ET..
Thank you for reading my sale's bulletin.
de Thomas J or Just T.j. -73
P.S. The power connector will fit all Kenwood and almost all
HF & vhf/uhf allmode Icom Radios.

Subject: RF and my computer

I am running a Yaesu Ft 101 into a dipole that runs right over my office.
For computers I have an HP 7320 pentium, a Toshiba laptop 486/75 and for
packet an old junker 486/25, all withing 10 feet of the radio and not more
than 20 feet from one end of the dipole. The old junker doesn't even have
the top on it anymore. I note that there is absolutley no impact to any of
this hardware. My only thought would be to have a good RF ground and see
what happens. I might add that I have more troubles with RF interference
on my telephone than anything else...

Bill, Matt,
I had the same problem on an AT&T 900 MHz phone. I took the keypad apart
and cleaned the conductive metal on the board with a pencil erase on
alcoho and put it back together. Works like new...for now. The rubber
pads were not worn on this unit however. Good luck

From: annen@execpc.com

Subject: Rubber Keypad problems

I have an Icom IC-2GXAT ht. About 6 months ago a few of the most used buttons stopped working. I cracked open the radio, and after some testing came to the conclusion that the conductive pads underneath the rubber keypad had worn down. I called Icom and ordered another keypad. Well, now six months later, the same problem. Has anyone else had this problem with the keypad on their radio? I am looking for solutions to this problem, other than having to order another pad from Icom every 6 months. An ideal solution would be to get a hold of the compound they use on the bottom of the pad. MCM sells the stuff, but at $25 a pop, you would think it had gold in it. Furthermore, the manufacturer of the gunk says it will cover 200 or more buttons, but they fail to clarify that it all has to be mixed at once (shameful for only 1 or two buttons). Anyone who has fixed this kind of problem please let me know. Thank You Matt Annen

Subject: Help! Best Way To Measure Doublet With MFJ-259?

On 24 Nov 1997 17:25:26 GMT, "DavidC" <davidc@bit-net.com> wrote:

>I have recently acquired a MFJ-259 Analyzer.
>I have a doublet antenna (200 feet per side fed with 450 line).
>What is the best way to look at this antenna using the MFJ-259?

Hello David,

I have always understood a doublet to mean a resonant dipole.(I could be wrong - I've been wrong on a lot of things lately). I have always referred to a non-resonant dipole fed with ladder line as a Center Fed Zepp.

All of that notwithstanding, the problem that you imply is that you have an unbalanced instrument to be connected to a balanced line. My solution to that has been to connect the MFJ-259 directly to the balanced line. I know this isn't kosher. However, it seems to work. Here's my criteria for that, and I may have just been lucky. I carefully built a 1:1 current Balun and checked it for the frequency range of interest to make sure it was acting like a balun should. Then I used it with the MFJ-259 to make my measurements on the CF Zepp. They agreed very well. I then substituted a piece of coax wound on an 8" form, that was approx. 1/4 wave on the frequency of interest. That makes a good balun. Again my measurements indicated that I could just use the MFJ-259 without any balun and get the same results. I really doubt that this procedure would work that well for higher frequencies - i.e., frequencies above 18 MHz.

Since you are about to find out that the impedance at the transmitter/tuner end of your antenna/feedline system is not what you would hope for, please do yourself a favor and check out:

From: "Clinton Peebles" <cpeebles_NOSPAM_@nel.auracom.com>
Subject: HF Noise in Toyota

I GOT IT!! First thing I did was wrap 3 wraps of tin foil around the distributer. Noise on 6m went from S9 to about S3... I can live with that :) And the truck was running at about 2500 rpm! There were a few holes so I added more foil pieces. Noise went from S3 back to S9, don't know why but they didn't last. Next, I cut a jam can in half and soldered the two pieces to make a short cylinder and put that over the dist. (removing the tin foil), then put tin foil over the top where the wires enter. 6 meters was cured! A single wrap of foil won't work, I tried that before..

Now on to 80m. Still S9 or better. I removed my old ground to the radiator and threw it away.. Had a look and like a dummy last year didn't remove the paint where the ground attached. Gotta remember it was December and really cold.. Got the wire wheel on the drill and removed the paint (ah duhh...) Then I got some braid from RG8 and used that to ground from the rad to the antenna to the block and to the frame. 80 meters and 40 meters were so quite I thought my antenna was broken :)

Oh yea, I put a 22,000 uF capacitor with a 14amp fuse on the alternator. That helped a bit.

Remove _NOSPAM to E-mail reply.

The best mod to expand frequencies in the IC-27A is to buy a transceiver
that does the coverage you want. The 27A/H were designed and built when
ham radios were just that, Ham Radios. No expanded coverage, no public
service scanner, just ham radio. Thats what made them great. They had
bullet proof front ends. When I ran my 27H mobile I never experienced the
intermod I run into with my w i d e new dual band transceivers.

I suggest the ARRL's Radio Amateurs Handbook, the RSGB Handbook, and the
Editors & Engineers Radio Handbook.

You might be able to get application notes from tube manufacterers for
specific tubes. Like the 3-500Z the 3CX800, etc....

A temporary fix is to coat the backside of the rubber buttons with
thinned rubber cement, then pour finely-ground carbon (you can use
ground-up pencil lead too) or locksmith's graphite over them.

When the rubber cement cures, you hopefully have enough conductive
material ahering to and imbedded with the rubber cement to substitute
for the deposited conductive material that used to be there.

Alternatively, you can make your own "conductive coating" by mixing
these ingredients ahead of time then applying them only to the areas
that need it.

It works, but depending on the quality of the job, it may not work for
a long period of time. Quality of materials and workmanship will
ultimately determine the time factor.

Steve

Subject: TM-V7A Software Info

Friends,

I got this from Kenwood today when I inquired about their EZ-Clone
software for the TM-V7A:

Dear Kenwood Customer:

Thank you for your e-mail. Kenwood has worked with a company called Applied Computing Systems to develop and produce the EZ-Clone Software for the TM-V7A. Unfortunately, this product has never readily become available for sale. Applied Computing Systems has decided not to continue the development of this project and will not distribute or support EZ-Clone software nor will they sell it in the future to the Amateur community.

We would like to apologize to our customers for this unfortunate and unforeseen end to this project. Kenwood is committed to producing programming software for the TM-V7A as well as other current Kenwood models. We anticipate that by the spring of 1998, we will have software available for your TM-V7A that you will be able to download from our FTP site. This software will be a genuine Kenwood Product not after market.

Thank you for your patience and understanding.

Sincerely,

Kenwood Customer Care

Despite Kenwood's claims above, some dealers still have the software and cable in stock if you want to call around. R&L Electronics in Hamilton, OH is one that does.

The Radio Shack amateur transceivers are traditionally not modifiable by design.

This has been true since the very first piece of RS amateur gear. Many Hams do
not believe this and buy them to find that they can not be modified. What you got

is what you got. It is my understanding that since they can not be modified,
their performance is really pretty good.

If I remember right, the new dual band hand held announced earlier this years
was
able to be modified and RS yanked it.

73, Bob

Subject: Wanted: Hallicrafters SX-43 manual/schematic/etc

Looking for documentation on Hallicrafters SX-43 receiver:
owner's manual, schematic, service info, Sams Photofact,
whatever I can get. Bought one of these sets at auction
last night as-is, with no documentation.

I'm sure I could get the manual from W7FG or HI Manuals,
but I'd like to try the less-expensive way first.

Will pay REASONABLE copying and postage costs (I specify
reasonable here because in the past, I've had folks offer
to copy 5-page manuals for me for a mere $20, etc).

Try going back to the old antenna. The least that can happen is that
your previous performance will return. You may also discover something
in the process of going back and forth, that would explain the
differences.

Don't forget, the scientific method demands changing only one thing at
a time.

Bob.

Hello Rick,

It must be a design defect with this particular Make & Model. FYI,
it's called the "Turbo Plus" (no other hint as to mfr.) and the FCC
ID# is NQK BITS6001 - for whatever that's worth.

FYI, folks. You can convert many currencies to most other currencies
at the following web site:

http://www.xe.net/currency/

This requires a forms-capable browser but provides currency conversion
for about 70 types of monetary units.

BTW, 210,000.00 JPY (Japanese Yen) is equivalent to
1,653.81 USD (American Dollars).

73 all!

From: Felix <hershman@ix.netcom.com>
Subject: Yaesu FT-847

Thanks for setting me straight! So I guess the Icom 746 at 198,000 Yen will be
even less!!

Also, I have more CONFIRMED INFO on the FT-847.
The radio DOES NOT have a built in TUNER . There is an OPTIONAL TUNER

model FC-20. There are two OPTIONAL filters for the 455khz IF.
500 HZ filter and a 2.75 KHZ Collins Mechanical Filter.

If you go to the following site you can confirm this.
http://www.martin-lynch.co.uk/
Anyways, the radio still looks interesting even though it doesn't have the
built
in tuner.
I don't have a price for the FC-20 BUT I HAVE A PRICE FOR THE FC-10 Tuner
for the FT-840 $380 !! That will bring the price for the radio and the tuner
to
$2000.
I may elect to buy the IC-746 for $1600 an give up the 440 MHZ band.

4016. Re: Kenwood TM-V7A Software?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-26 00:00:00 UTC
From: Bill <billrk@desupernet.net>
Message-ID: <01bcfa17$dde07d80$9955f6cd@hp-customer>
Source record: 160971

Here is a message that I received on Monday from Kenwood.

>Bill Kirkner at billrk@desupernet.net had the following request for help:

>Is it true that kenwood is going to provide the proper softwear to program
the TM-V7A? I was told this by a dealer but as of this date I have been
able to find it. The softwear I am refering to is the EZ Clone..Thanks for
your help73 N3pzaBill Kirkner

//
//////////////////////////////////////

Dear Kenwood Customer:

Thank you for your e-mail. Kenwood has worked with a company called
Applied Computing Systems to develop and produce the EZ-Clone Software for
the TM-V7A. Unfortunately, this product has never readily become available
for sale. Applied Computing Systems has decided not to continue the
development of this project and will not distribute or support EZ-Clone
software nor will they sell it in the future to the Amateur community.

We would like to apologize to our customers for this unfortunate and
unforeseen end to this project. Kenwood is committed to producing
programming software for the TM-V7A as well as other current Kenwood
models. We anticipate that by the spring of 1998, we will have software
available for your TM-V7A that you will be able to download from our FTP
site. This software will be a genuine Kenwood Product not after market.

Thank you for your patience and understanding.

Sincerely,

Kenwood Customer Care

Subject: ? $88 handhelds available?

You heard right...
Available from TechAmerica (RS affiliate), low power (350 mW, I think) 2m or
70cm ht's. Run on Alkaline AA batts, no NiCad pack listed for them. Can't
find my sale flyer right now, but I think they were Icoms.
$88.00
Use would be limited with the low power out, but interesting anyhow.

nospam.pcuellar@bright.net

Actually, they are Alinco units.
The range is limited-but for LOCAL repeaters, or LOCAL simplex, they are
useable.
Note that some users have reported problems with the antenna mount.

Subject: RF and my computer

I am running a Yaesu Ft 101 into a dipole that runs right over my office. For computers I have an HP 7320 pentium, a Toshiba laptop 486/75 and for

packet an old junker 486/25, all withing 10 feet of the radio and not more than 20 feet from one end of the dipole. The old junker doesn't even have the top on it anymore. I note that there is absolutley no impact to any of this hardware. My only thought would be to have a good RF ground and see what happens. I might add that I have more troubles with RF interference on my telephone than anything else...

Bill, Matt,
I had the same problem on an AT&T 900 MHz phone. I took the keypad apart and cleaned the conductive metal on the board with a pencil erase on alcoho and put it back together. Works like new...for now. The rubber

pads were not worn on this unit however. Good luck

From: annen@execpc.com
Subject: Rubber Keypad problems

I have an Icom IC-2GXAT ht. About 6 months ago a few of the most used buttons stopped working. I cracked open the radio, and after some testing came to the conclusion that the conductive pads underneath the rubber keypad had worn down. I called Icom and ordered another keypad. Well, now six months later, the same problem. Has anyone else had this problem with the keypad on their radio? I am looking for solutions to this problem, other than having to order another pad from Icom every 6 months. An ideal solution would be to get a hold of the compound they use on the bottom of the pad. MCM sells the stuff, but at $25 a pop, you would think it had gold in it. Furthermore, the manufacturer of the gunk says it will cover 200 or more buttons, but they fail to clarify that it all has to be mixed at once (shameful for only 1 or two buttons). Anyone who has fixed this kind of problem please let me know. Thank You Matt
Annen

Subject: Help! Best Way To Measure Doublet With MFJ-259?

On 24 Nov 1997 17:25:26 GMT, "DavidC" <davidc@bit-net.com> wrote:

>I have recently acquired a MFJ-259 Analyzer.
>I have a doublet antenna (200 feet per side fed with 450 line).
>What is the best way to look at this antenna using the MFJ-259?

Hello David,

I have always understood a doublet to mean a resonant dipole.(I could be wrong - I've been wrong on a lot of things lately). I have always referred to a non-resonant dipole fed with ladder line as a Center Fed Zepp.

All of that notwithstanding, the problem that you imply is that you have an unbalanced instrument to be connected to a balanced line. My solution to that has been to connect the MFJ-259 directly to the balanced line. I know this isn't kosher. However, it seems to work. Here's my criteria for that, and I may have just been lucky. I carefully built a 1:1 current Balun and checked it for the frequency range of interest to make sure it was acting like a balun should. Then I used it with the MFJ-259 to make my measurements on the CF Zepp. They agreed very well. I then substituted a piece of coax wound on an 8" form, that was approx. 1/4 wave on the frequency of interest. That makes a good balun. Again my measurements indicated that I could just use the MFJ-259 without any balun and get the same results. I really doubt that this procedure would work that well for higher

frequencies - i.e., frequencies above 18 MHz.

Since you are about to find out that the impedance at the
transmitter/tuner end of your antenna/feedline system is not what you
would hope for, please do yourself a favor and check out:

http://people.delphi.com/cecilmoore/mystery.htm
Which is titled "W6RCA's No-Tuner, All-HF-Band,
Horizontal, Center-Fed Antenna".

From: "Clinton Peebles" <cpeebles_NOSPAM_@nel.auracom.com>
Subject: HF Noise in Toyota

I GOT IT!! First thing I did was wrap 3 wraps of tin foil around the distributer. Noise on 6m went from S9 to about S3... I can live with that :) And the truck was running at about 2500 rpm! There were a few holes so I added more foil pieces. Noise went from S3 back to S9, don't know why but they didn't last. Next, I cut a jam can in half and soldered the two pieces to make a short cylinder and put that over the dist. (removing the tin foil), then put tin foil over the top where the wires enter. 6 meters was cured! A single wrap of foil won't work, I tried that before..

Now on to 80m. Still S9 or better. I removed my old ground to the radiator and threw it away.. Had a look and like a dummy last year didn't remove the paint where the ground attached. Gotta remember it was December and really cold.. Got the wire wheel on the drill and removed the paint (ah duhh...) Then I got some braid from RG8 and used that to ground from the rad to the antenna to the block and to the frame. 80 meters and 40 meters were so quite I thought my antenna was broken :)

Oh yea, I put a 22,000 uF capacitor with a 14amp fuse on the alternator. That helped a bit.

Remove _NOSPAM to E-mail reply.

The best mod to expand frequencies in the IC-27A is to buy a transceiver
that does the coverage you want. The 27A/H were designed and built when
ham radios were just that, Ham Radios. No expanded coverage, no public
service scanner, just ham radio. Thats what made them great. They had
bullet proof front ends. When I ran my 27H mobile I never experienced the
intermod I run into with my w i d e new dual band transceivers.

I suggest the ARRL's Radio Amateurs Handbook, the RSGB Handbook, and the
Editors & Engineers Radio Handbook.

You might be able to get application notes from tube manufacterers for specific tubes. Like the 3-500Z the 3CX800, etc....

>Thanks and good luck,

>Bill

A temporary fix is to coat the backside of the rubber buttons with thinned rubber cement, then pour finely-ground carbon (you can use ground-up pencil lead too) or locksmith's graphite over them.

When the rubber cement cures, you hopefully have enough conductive material ahering to and imbedded with the rubber cement to substitute for the deposited conductive material that used to be there.

Alternatively, you can make your own "conductive coating" by mixing these ingredients ahead of time then applying them only to the areas that need it.

It works, but depending on the quality of the job, it may not work for a long period of time. Quality of materials and workmanship will ultimately determine the time factor.

From: Mitchell Hamm <mitch@xpalmtop.net>
Subject: TM-V7A Software Info

Friends,

I got this from Kenwood today when I inquired about their EZ-Clone
software for the TM-V7A:

Dear Kenwood Customer:

Thank you for your e-mail. Kenwood has worked with a company called
Applied Computing Systems to develop and produce the EZ-Clone Software
for the TM-V7A. Unfortunately, this product has never readily become
available for sale. Applied Computing Systems has decided not to
continue the development of this project and will not distribute or
support EZ-Clone software nor will they sell it in the future to the
Amateur community.

We would like to apologize to our customers for this unfortunate and
unforeseen end to this project. Kenwood is committed to producing
programming software for the TM-V7A as well as other current Kenwood
models. We anticipate that by the spring of 1998, we will have software
available for your TM-V7A that you will be able to download from our FTP
site. This software will be a genuine Kenwood Product not after
market.

Thank you for your patience and understanding.

Sincerely,

Kenwood Customer Care

Despite Kenwood's claims above, some dealers still have the software and
cable in stock if you want to call around. R&L Electronics in Hamilton,
OH is one that does.

> Please e-mail jcox@gibraltar.k12.wi.us.

The Radio Shack amateur transceivers are traditionally not modifiable by
design.

This has been true since the very first piece of RS amateur gear. Many Hams
do
not believe this and buy them to find that they can not be modified. What you
got
is what you got. It is my understanding that since they can not be modified,
their performance is really pretty good.

If I remember right, the new dual band hand held announced earlier this years
was
able to be modified and RS yanked it.

Try going back to the old antenna. The least that can happen is that
your previous performance will return. You may also discover something
in the process of going back and forth, that would explain the
differences.

Don't forget, the scientific method demands changing only one thing at
a time.

Subject: Yaesu FT-847

Thanks for setting me straight! So I guess the Icom 746 at 198,000 Yen will be even less!!

Also, I have more CONFIRMED INFO on the FT-847.
The radio DOES NOT have a built in TUNER . There is an OPTIONAL TUNER model FC-20. There are two OPTIONAL filters for the 455khz IF.
500 HZ filter and a 2.75 KHZ Collins Mechanical Filter.

If you go to the following site you can confirm this.
http://www.martin-lynch.co.uk/
Anyways, the radio still looks interesting even though it doesn't have the built
in tuner.
I don't have a price for the FC-20 BUT I HAVE A PRICE FOR THE FC-10 Tuner for the FT-840 $380 !! That will bring the price for the radio and the tuner to
$2000.
I may elect to buy the IC-746 for $1600 an give up the 440 MHZ band.

I have some of the same feelings about mine. I'm not very pleased w/ the intermod rejection either. I don't agree w/ you about the audio being great though...external speakers are almost a must. I use my mobile hard and have found the V7A very useful in most cases, but a priority would be very helpful for those of us in public safety.

It depends on what you're going to use to measure the voltage. An oscilloscope probably won't be sensitive enough. Some (not many) spectrum analyzers might be. the manual is pretty clear. They recommend an RF millivoltmeter or another receiver. Follow the directions explicitly. You're going to be down in the low mV range.

From: "Phil" <pcuellar@bright.net>
Subject: ? $88 handhelds available?

You heard right...
Available from TechAmerica (RS affiliate), low power (350 mW, I think) 2m or
70cm ht's. Run on Alkaline AA batts, no NiCad pack listed for them. Can't
find my sale flyer right now, but I think they were Icoms.
$88.00
Use would be limited with the low power out, but interesting anyhow.

nospam.pcuellar@bright.net

Actually, they are Alinco units.
The range is limited-but for LOCAL repeaters, or LOCAL simplex, they are
useable.
Note that some users have reported problems with the antenna mount.

Subject: RF and my computer

I am running a Yaesu Ft 101 into a dipole that runs right over my office.
For computers I have an HP 7320 pentium, a Toshiba laptop 486/75 and for
packet an old junker 486/25, all withing 10 feet of the radio and not more
than 20 feet from one end of the dipole. The old junker doesn't even have
the top on it anymore. I note that there is absolutley no impact to any of
this hardware. My only thought would be to have a good RF ground and see
what happens. I might add that I have more troubles with RF interference
on my telephone than anything else...

Bill, Matt,
I had the same problem on an AT&T 900 MHz phone. I took the keypad apart
and cleaned the conductive metal on the board with a pencil erase on
alcoho and put it back together. Works like new...for now. The rubber
pads were not worn on this unit however. Good luck
George

From: annen@execpc.com
Subject: Rubber Keypad problems

I have an Icom IC-2GXAT ht. About 6 months ago a few of the most used
buttons stopped working. I cracked open the radio, and after some
testing came to the conclusion that the conductive pads underneath the
rubber keypad had worn down. I called Icom and ordered another keypad.
Well, now six months later, the same problem. Has anyone else had this
problem with the keypad on their radio? I am looking for solutions to
this problem, other than having to order another pad from Icom every 6
months. An ideal solution would be to get a hold of the compound they
use on the bottom of the pad. MCM sells the stuff, but at $25 a pop, you
would think it had gold in it. Furthermore, the manufacturer of the gunk
says it will cover 200 or more buttons, but they fail to clarify that it

all has to be mixed at once (shameful for only 1 or two buttons). Anyone
who has fixed this kind of problem please let me know. Thank You Matt
Annen

Try cleaning both the pads and the PCB with rubbing alchohol. This
usually works quite well.

Subject: Help! Best Way To Measure Doublet With MFJ-259?

On 24 Nov 1997 17:25:26 GMT, "DavidC" <davidc@bit-net.com> wrote:

>I have recently acquired a MFJ-259 Analyzer.
>I have a doublet antenna (200 feet per side fed with 450 line).
>What is the best way to look at this antenna using the MFJ-259?

Hello David,

I have always understood a doublet to mean a resonant dipole.(I could be wrong - I've been wrong on a lot of things lately). I have always referred to a non-resonant dipole fed with ladder line as a Center Fed Zepp.

All of that notwithstanding, the problem that you imply is that you have an unbalanced instrument to be connected to a balanced line. My solution to that has been to connect the MFJ-259 directly to the balanced line. I know this isn't kosher. However, it seems to work. Here's my criteria for that, and I may have just been lucky. I carefully built a 1:1 current Balun and checked it for the frequency range of interest to make sure it was acting like a balun should. Then I used it with the MFJ-259 to make my measurements on the CF Zepp. They agreed very well. I then substituted a piece of coax wound on an 8" form, that was approx. 1/4 wave on the frequency of interest. That makes a good balun. Again my measurements indicated that I could just use the MFJ-259 without any balun and get the same results. I really doubt that this procedure would work that well for higher frequencies - i.e., frequencies above 18 MHz.

Since you are about to find out that the impedance at the transmitter/tuner end of your antenna/feedline system is not what you would hope for, please do yourself a favor and check out:

http://people.delphi.com/cecilmoore/mystery.htm
Which is titled "W6RCA's No-Tuner, All-HF-Band,
Horizontal, Center-Fed Antenna".

From: "Clinton Peebles" <cpeebles_NOSPAM_@nel.auracom.com>
Subject: HF Noise in Toyota

I GOT IT!! First thing I did was wrap 3 wraps of tin foil around the distributer. Noise on 6m went from S9 to about S3... I can live with that :) And the truck was running at about 2500 rpm! There were a few holes so I added more foil pieces. Noise went from S3 back to S9, don't know why but they didn't last. Next, I cut a jam can in half and soldered the two pieces to make a short cylinder and put that over the dist. (removing the tin foil), then put tin foil over the top where the wires enter. 6 meters was cured! A single wrap of foil won't work, I tried that before..

Now on to 80m. Still S9 or better. I removed my old ground to the radiator and threw it away.. Had a look and like a dummy last year didn't remove the paint where the ground attached. Gotta remember it was December and really cold.. Got the wire wheel on the drill and removed the paint (ah duhh...) Then I got some braid from RG8 and used that to ground from the rad to the antenna to the block and to the frame. 80 meters and 40 meters were so quite I thought my antenna was broken :)

Oh yea, I put a 22,000 uF capacitor with a 14amp fuse on the alternator. That helped a bit.

The best mod to expand frequencies in the IC-27A is to buy a transceiver
that does the coverage you want. The 27A/H were designed and built when
ham radios were just that, Ham Radios. No expanded coverage, no public
service scanner, just ham radio. Thats what made them great. They had
bullet proof front ends. When I ran my 27H mobile I never experienced the
intermod I run into with my w i d e new dual band transceivers.

I suggest the ARRL's Radio Amateurs Handbook, the RSGB Handbook, and the
Editors & Engineers Radio Handbook.

You might be able to get application notes from tube manufacterers for
specific tubes. Like the 3-500Z the 3CX800, etc....

A temporary fix is to coat the backside of the rubber buttons with
thinned rubber cement, then pour finely-ground carbon (you can use
ground-up pencil lead too) or locksmith's graphite over them.

When the rubber cement cures, you hopefully have enough conductive
material ahering to and imbedded with the rubber cement to substitute
for the deposited conductive material that used to be there.

Alternatively, you can make your own "conductive coating" by mixing
these ingredients ahead of time then applying them only to the areas
that need it.

It works, but depending on the quality of the job, it may not work for
a long period of time. Quality of materials and workmanship will
ultimately determine the time factor.

Subject: TM-V7A Software Info

Friends,

I got this from Kenwood today when I inquired about their EZ-Clone
software for the TM-V7A:

Dear Kenwood Customer:

Thank you for your e-mail. Kenwood has worked with a company called
Applied Computing Systems to develop and produce the EZ-Clone Software
for the TM-V7A. Unfortunately, this product has never readily become
available for sale. Applied Computing Systems has decided not to
continue the development of this project and will not distribute or
support EZ-Clone software nor will they sell it in the future to the
Amateur community.

We would like to apologize to our customers for this unfortunate and unforeseen end to this project. Kenwood is committed to producing programming software for the TM-V7A as well as other current Kenwood models. We anticipate that by the spring of 1998, we will have software available for your TM-V7A that you will be able to download from our FTP site. This software will be a genuine Kenwood Product not after market.

Thank you for your patience and understanding.

Sincerely,

Kenwood Customer Care

Despite Kenwood's claims above, some dealers still have the software and cable in stock if you want to call around. R&L Electronics in Hamilton, OH is one that does.

The Radio Shack amateur transceivers are traditionally not modifiable by design.

This has been true since the very first piece of RS amateur gear. Many Hams do
not believe this and buy them to find that they can not be modified. What you got
is what you got. It is my understanding that since they can not be modified, their performance is really pretty good.

If I remember right, the new dual band hand held announced earlier this years was
able to be modified and RS yanked it.

Try going back to the old antenna. The least that can happen is that
your previous performance will return. You may also discover something
in the process of going back and forth, that would explain the
differences.

Don't forget, the scientific method demands changing only one thing at
a time.

Subject: Yaesu FT-847

Thanks for setting me straight! So I guess the Icom 746 at 198,000 Yen will be even less!!

Also, I have more CONFIRMED INFO on the FT-847.
The radio DOES NOT have a built in TUNER . There is an OPTIONAL TUNER model FC-20. There are two OPTIONAL filters for the 455khz IF.
500 HZ filter and a 2.75 KHZ Collins Mechanical Filter.

If you go to the following site you can confirm this.
http://www.martin-lynch.co.uk/
Anyways, the radio still looks interesting even though it doesn't have the built
in tuner.
I don't have a price for the FC-20 BUT I HAVE A PRICE FOR THE FC-10 Tuner for the FT-840 $380 !! That will bring the price for the radio and the tuner to
$2000.
I may elect to buy the IC-746 for $1600 an give up the 440 MHZ band.

I have some of the same feelings about mine. I'm not very pleased w/ the
intermod rejection either. I don't agree w/ you about the audio being
great though...external speakers are almost a must. I use my mobile hard
and have found the V7A very useful in most cases, but a priority would be
very helpful for those of us in public safety.

It depends on what you're going to use to measure the voltage. An
oscilloscope probably won't be sensitive enough. Some (not many)
spectrum analyzers might be. the manual is pretty clear. They
recommend an RF millivoltmeter or another receiver. Follow the directions
explicitly. You're going to be down in the low mV range.

From: kevinm@infinity.ccsi.com (KW5Q)
Subject: IC-756

Has Icom cleaned up the IC-756 HFO? I've seen spectra of the 756 signals on CW, and the HFO sideband levels are about 20 dB worse at a given separation from the carrier than the IC-765. Has Icom done anything to fix this?

From: lcval1@mail.NETcon.NET.AU (Damien & Linda Vale)
Subject: IC-775DSP ALC?

Using an SM-20 base mike with an IC-775DSP. Is the ALC indication on this model's meter normally sluggish, or is it my unit? It seems that the meter is not as lively as with the Kenwood units I'm used to. A slight increase in the Mic Gain (or Drive when using compresion) results in pinning the meter at the maximum ALC point, which I have carefully avoided. However in a recent pileup when the DX station was having trouble hearing me, I increased the Drive slightly which pinned the ALC, but the station said "wow, you've really come up - nice signal", so maybe it is not that critical.

//
////////////////////////////////////

Dear Kenwood Customer:

Thank you for your e-mail. Kenwood has worked with a company called
Applied Computing Systems to develop and produce the EZ-Clone Software for
the TM-V7A. Unfortunately, this product has never readily become available
for sale. Applied Computing Systems has decided not to continue the
development of this project and will not distribute or support EZ-Clone
software nor will they sell it in the future to the Amateur community.

We would like to apologize to our customers for this unfortunate and
unforeseen end to this project. Kenwood is committed to producing
programming software for the TM-V7A as well as other current Kenwood
models. We anticipate that by the spring of 1998, we will have software
available for your TM-V7A that you will be able to download from our FTP
site. This software will be a genuine Kenwood Product not after market.

Thank you for your patience and understanding.

Sincerely,

Kenwood Customer Care

>73 de PD1ADI (Pleun.. JO21WT, Nijmegen, The Netherlands)
Hi again Pleun,
In the UK you can get a PW Meon transverter which can be configured for
either a 28MHz or a 144 MHz IF. It was originally produced as a
constructional article in 'Practical Wireless' magazine. You can still
buy the PCB from them and I believe that there are one or two companies
here which will sell the component kits if you need them. If you source
the components yourself, and they are all fairly easy to get hold of, I
expect it would cost around 30UKP to build; less if you have a good junk
box.
I have used the 28 MHz IF version for several years and it has served me
very well. Output is just one watt but it is simple to add a single
stage PA to take it to a more useful level.

73 Trev G3ZYY ...-.-
PS, I can send you a JPEG version of the circuit diagram if you wish,
(by e-mail) but it is an 820K file!

>opinion that Yaesu just LEFT the HF mobile arena.
>
>Pete -- KA2YDY

Who decided that this is a FT900 replacement? I think that your
840 replacement idea is probably more accurate, but this radio
should actually cost more than the 920. Maybe it's more like a
new 767GX. If Yaesu bails on the 736R, then I think that they'll
probably come out with a replacement specifically for that radio.
I'm sure that they sell a fair number to rich NC-Techs who use
them to do sat work and EME. That market has no use for HF. I
could see Yaesu coming out with a 144/440/1200/2400 radio to
take advantage of more modes on Phase 3D.

From the picture in the HRO catalog, the radio looks like it falls
somewhere between the 840 and the 920 in terms of size. Definitely
much larger than the 900. If Yaesu is replacing the 900, then I'd
look for something the size of an IC706 or a DX70.

If this radio has an IF DSP, then it will be a first for Yaesu.
The "IF" DSP in the 1000MP works at a 10khz IF. Not very useful
for front-end rejection (hence the major bank of filters), but
still handy because it avoids any crud introduced in the AF.

Remove the "NoQRM." in my address to reply. Don't you hate unsolicited
e-mail advertisements? Me too. I apologize for the inconvenience.

True but this is the first major frequency expansion I have seen in a
single rig in a long time. 6 meter capability has been around for a
while and the IC-706MKII's 2-meter coverage was certainly interesting.

Ramsey Electronics sells a Stereo FM Xmtr of 100milliwatts out which
is legal in US and Canada and can cover 300ft easily...
Check with them (I think they have a web page.....use a search engine
to check for it)

Thor,
MOST modern synthesized rigs will work on 6 from commercial lowband
BUT the rcvr DOES need to be retuned...also check the VCOs..
they typically need retuning to peak them in the 6mtr band...
I took several GEs and Midlands into 6 mtr FM with no problems..

4033. FT-8000 Fix

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-27 00:00:00 UTC
From: Jim Finney <jpf@southeast.net>
Message-ID: <347D7817.1D3A@southeast.net>
Source record: 160739

Help,

Well, I did something really stupid. I accidentally put 35 watts of 146 mHz power into the output of my FT-8000. The result is the 2 meter receiver is now deaf. Everything else still works OK. I do not have a schematic for this radio. Anyone have a suggestion on how to fix it?

Thanks,

Jim...

"Counterpoise"...

Just use another piece of random wire, long as possible, laid along the
floor or outside on the ground as your RF ground. In many cases, it's
better than a ground rod.

> http://home.rose.net/~abc

Hi, sure there is: Take off back cover of the radio by removing three screws. Towards the lower end of the PC board, about half way accross, locate a short red-wire jumper loop. Cut or desolder this wire, then reset the radio per the instruction manual. The S1 will now program from 380 - 473 MHz. Exact lock range of the PLL is currently unknown, but it does receive very well at least up through 465 MHz. DO NOT transmit where you are not supposed to... Hint: extra sub-mini stereo plugs(for the external speaker/mic conn), are avialable from Mouser for about .50 each Enjoy DE WA1YKL

I have a 570D and like it very much; big improvement over my TS-440SAT.

Never tried the tuner at 5 watts, tho .. but I think it may tune at less than max power in any case. Of course, you could always tune up and then reduce the power (very easy to do).

There is an extensive review of the radio in the Jan 1997 QST which is quite favorable.

Phil

Agree!

I have a 570D and find it to work well, but only if you get the hang of setting the adjustments. Also CW DSP is incredible (NR2), so long as a 500Hz cw filter is added to handle strong, nearby (in frq) signals.

From: "P.Shintani" <shintani@tv.sony.co.jp>
Message-ID: <01bcfb7f$519d1a40$2a03022b@ea>
Source record: 160755

Hi:
Just yesterday I dropped in on a store in Akihabara, "Rocket Musen".
They had some new Yaesu catalogs.
The Japanese domestic FT-847 does not include an internal tuner.
The optional external tuner is a new product and it't model name is
the FC-20. The neat thing about this radio is that it can accept
Collins Mechanical filters, two are available, CW 500 Hz and
SSB(no BW given)

Perhaps why the radio looks fat is that it is pretty small. Looks at
the dimensions, 260 wide by 86 high by 270 mm deep.It's
also pretty light at only 7kg considering that it's chassis is die cast,
or atleast the picture looks as if it die cast. It even has two cooling
fan,
however, they are a size smaller than typical.

The explaination of the DSP does not make any mention of
processing speed nor whether it is processing at IF or at AF.
The catalog I have, does not mention the IF frequencies used in this
rig but I since it can accept Collins mechanical filters, most likely
the 2nd or 3rd IF is at 455 kHz. There is no mention of other filter
options so perhaps a 8 or 9 MHz IF is not used, as in the FT-900.
(the FT-920 had it's second IF at around 9 MHz)

I find it hard to beleive that they manage to pack all the features inside,
50 W on 144/430 on the Japanese model ! How much does the
export model put out ?

Yes, it is soooooo hard to program the FT8100 (I've got an 8000) lets see.....
dial upthe freq you want - hold down F/W for 1 sec. - select the memory slot
you want to
store the freq in - and press F/W again! Gee, and I didn't even have to look
at my
manual!

Tell me, how do you read the user guide on the TM-V7A while you are driving?

> You can FEEL the buttons.

Um - did you actually touch the front of the 8100 when you had it? I can
certainlyfeel the buttons on the front of my 8000!

==========
I have been using the Comet SMA-3 on my FT-50RD since I got it. With
5 watts, I am able to get full quieting or very near it on 2 meters
into repeaters that are quite far away. I can get into the Mount
Greylock Mass. machine from 60 miles away, full quieting.

On 440 Mhz, I have less experience, but have gotten into good location
repeaters from 40+ miles away with no problem.

The only downsides to the SMA-3 are price (about $40) and the fact
that the semi-stiff upper part of the antenna gets bent and has to be
straightened out every now and then.

I have read that SMA connectors are not meant for frequent attachment
and removal of antennas. Once you attach them, it is preferable that
they stay attached. Apparently in the attachment process, something
in the antenna connector is intentionally physically distorted to make
a better connection. As a result, I do not routinely detach my SMA-3
from the RD-50.

I would buy the SMA-3 again.

I was always on the understanding that 2.45GHz is the resonant frequency
of hydrogen atoms - hence the rapid heating of microwaved food. I'm not
a biologist but it makes sense to me.

I think the significance of the hazard will become more apparent in a
few years.

Hello Craig,

Hope this isn't way off the mark, but here goes.

I have something on the JPS NIR-12 Dual DSP that sounds related.

You may be referring to what is called the "Bypass" circuit that is
used to bypass the DSP during CW key down. If so, you can bring your
CW key's hot terminal to that Bypass connection on the DSP in order to
ground the bypass circuit (thus bypassin the DSP) during CW
transmission - otherwise your CW sidetone may not be audible in your
earphones. Such is the case at my QTH. You could also use the Linear
T/R line coming out of the Icom for the same purpose, but it may not
be as QSK as the above method.

>a biologist but it makes sense to me.

Unfortunately for that theory, it isn't true. There are no resonances of H2, H+, OH-, or H2O near 2.45 GHz. It is just plain old dielectric heating at work here. (The first absorption line for water molecules occurs near 22 GHz.)

Microwave ovens heat any material which has a molecular structure which has a dipolar moment. Many biological molecules do, including all fats. Water also has a slight dipolar moment because of the angle of the hydrogen bonds with the oxygen atom (this is what gives rise to van der Waals forces in water). A dipolar molecule has a net charge separation across the molecule. These two poles can be *torqued* by an electric field. If the field is time varying, IE AC (RF), then the molecules torque back and forth in place. This vibration is sensible *heat*.

Where resonance comes into play is *external* to the material being heated. For maximum efficiency, the varying potential needs to be *large*. That is supplied by the resonant cavity which has resonance nodes which maximize the potential expressed across the food inserted into the cavity, and thus maximize the torque delivered to the dipolar molecules of the material to be heated. (That's why microwave ovens have *hot spots*, which are points equidistant between opposite polarity standing nodes in the cavity. And that's why microwave ovens either have turntables to rotate the food, or a mode stirring device, looks like a slow turning fan, to vary the resonance pattern in the cavity to reduce hot spotting.)

Note also that microwave ovens do not heat from the inside out. They heat to the skin depth of the material being heated. That's a function of material conductance and the frequency used. For deeper heating, lower frequencies are preferred. Large institutional microwave ovens used 915 MHz to allow cooking of thicker food sections, IE whole hams, or whole roasts. The trick of using aluminum foil to reduce heating of thin sections, IE the extremities of fowl, is an application of skin effect.

(Aluminum foil has a very shallow skin depth compared to foods.)

There are industrial dielectric heaters which use even lower frequencies. Plywood is cured using frequencies in the 27 MHz ISM band. That works out nicely since plywood is typically supplied in 8 foot lengths, so the heating cavity works out to be a nice fit. (Before CBers get too excited, these are power oscillators, not amplifiers, so forget about adapting them to CB.)

From: Richard Innes <rinnes@globalnet.co.uk>
Message-ID: <01bcfb5f$d7f8c140$125f7ec2@default>
Source record: 160813

I am writing on behalf of GM1 EHK.

We urgently need Scematic or Wiring Diagrams and a setup instructions for tuning For A Sota 100w Linear Amplifier With Preamp and built in PSU. (Uk Mains, Base Unit, Solid State)

All we know is the amp is quite rare and the company was in Liverpool (We Think!)

There is a problem inside the amp and would like to fix it ASAP.

If anyone can help, please contact me and we will arrange either a fax or E-mail attachment.

If anyone knows someone who can repair this in central scotland, we would appreciate any relevant information.

Many Thanks

From: Yves Remedios <yves@g4udt.nospam.co.uk>
Message-ID: <Pj$G4JA1ccf0EwSY@g4udt.demon.co.uk>
Source record: 160819

I have a problem with the squelch on band 1 (FM broadcast band). The squelch refuses to open in Squelch Auto but can be opened if I move the squelch to open and back to auto. The works ok on SQL 1 but I am then forced to use SQL 1 on all the other bands.

This problem has been there since new and I have not used ADMS software with this radio. The settings for band 1 (not changed by me) are:

HSSQ03
HASQ08
THSQ5B
TISQ3B
WDSQ10
S1LV49
S9LVBE

Are any of these settings wrong?

hi there, if the conductive material on the back of the rubber keypad
wore out in 6 mos. you must have been punching a hell of a lot of keys
repeatedly, however once you have cleaned the surfaces properly
w/alcohol, get in touch with a local dist. of tv radio electronic
supplies. they make a jar of liquid conductive material that you brush on
the individual keys to replace the stuff that wears off. this stuff
works, but you should see how much icom wants for a new keypad and weigh
the $$$. hope this helps. alan KT4GH

From what I see on the Yaesu.co.uk/ website, it has dedicated sattlite mem.s,
I am interested to find out if it can crossband repeat, and if it goes to the
440mhz repeater bands... anyone know?
It has full crossband duplex and dual display on the freq. display.
Any more info would be appriciated.

>I really like the Comet SMA-3, and recommend it highly!

I have both the SMA-3 and SMA-503. The -3 seems to be slightly better than the -503 on amateur frequencies, but I use the -503 almost all the time. It's so much more flexible than either the SMA-3 or the original antenna - no more antenna poking me in the ribs! It's still quite a bit better than the Yaesu stock antenna.

I seldom use radio outside ham bands, even for listening, so the SMA-3 might well be substantially better than the -503 there. But for amateur frequency use, I'd recommend the -503 for its greater convenience and only slightly poorer performance.

I've heard that Premier Communications will come out with the RD-98 with SMA connection next week. They priced it at $27.95 and it's longer and more flexible than the SMA-3. I tried it with the SMA to BNC adapter and it's as good as the SMA-3 on both VHF and UHF. Plus it's $12 cheaper than the SMA-3.

If you're thinking about hand held radio, you may want to take a look at
the
Radio Shack HTX-202. It's a little big and not as sexy as the newer HTs,
but it's easy to use and works great. It will NOT receive out of band,
but this
may be a plus to you if you're in an area with inter mod problems. I
believe that
Radio Shack now has the unit on sale for $199.99.

You could use the radio in the car, just add a 12 volt power adapter, a
5/8 wave
mag mount antenna, and if you want, a speaker / mike. I ran that way for
a
while and found it a bit hard to use while I drove. So I went out and
purchased
an Alinco DR-605T dual band (2M/440) radio. I'm very happy with it. If
you
don't need the 440 band, consider the Alinco DR-140 (2M) radio.

By the way, the rubber ducky antenna that comes with any HTs is small, but

really cuts into your signal. I put a 2 M J-Pole antenna on my roof (no
tower)
and this allows me to reach lots of repeaters with very little power. If
you can't
put anything on your roof, at least try to connect the radio at home to a
bigger
antenna than the small rubber ducky that comes with an HT. One fellow HAM

I know lives in an apartment building and can't put anything on the roof.
So he puts a 5/8 wave mag mount on a metal plate and sticks it on his
balcony.

This works a lot better than just a small antenna inside his apartment.

If I was forced to own just one HAM radio, I would have my one radio be my car radio. I spend more time on the air and listening in my car than at
home.

One last thing, please contact your local HAM club(s). You'll find lots of
fellow HAMs there who can give you all sort of tips and ideas in picking your first radio and they can tell you which repeaters are the best to use.
To locate these clubs, please go to the following web location:

http://www.arrl.org/field/club/

Hi there,

I have a Ranger Communications RCI-6030 VHF-Marine rig which I want to trade for a scanner. The RCI-6030 has the following features: All USA and International channels (156-162 MHz), all 10 NOAA weather channels, 25 watts output power (full legal power), 1 watt low power, Dual Channel Watch, Instant Channel 16, Digital PLL tuning, backlit LCD display, "water tight" casing, and more. Comes with the microphone (with channel control on mic). Very good condition. This is a current production unit, not discontinued. I am looking for a portable or base/mobile scanner (preferably portable) which covers 800 MHz (not nessesarly gapless 800 MHz), and preferably also the VHF Air Band (118-136 MHz). Any number of channels will do. Anything in good condition will also do. Please email me if you have any offer. I am in the Philadelphia, PA area. Thanks.

Good direction Dave, a ground plane independant antenna is a must. Rather than use a j-pole, though, which has the added length of the 1/4-wave matching section (and other issues covered in many previous threads, perhaps you may wish to do a search on Deja News), you may wish to spring for a few $$ and use the AEA collapsable 1/2 wave Hot Rod. Have mine mounted on a mountain bike using aluminum from an old unused p-box (nice because it has some give to absorb minor shock & vibration): drill a hole for mounting a panel mount BNC female connector, then a set of holes to mount on the rear where the wheel is attached (pardon my forgetting the correct technical names); bend the metal 90-degress then mount the BNC connector and add suitable length of coax (for a short run you can even use RG-174 and it is easier to attach to an SMA connector) with a male SMA connector; mount the assembly to the bike, remember to use lockwashers and you may wish to 'torque stripe' the nuts to the screws with a dab of expoxy (further prevents nuts from vibrating off and can be broken off if you need to remove); route the coax and you are in business. The nice thing about the collapsable antenna is that it can be out of the way when you are not using it. I have had great success with this setup, when covering a 10K race in a hilly area using only 2.5W Net Control always heard me regardless of my location, some of the stationary stations were tough copy for Net Control, even with their 5W output (the 1/2-wave antenna is very noticeably better than any stock rubber duck).

Dave gave you solid advice on the microphone issue also, VOX just doesn't work well for bicycle mobile.

Howard KE6MAK

WELL, you DO have to know how to operate it.... And, after a very short
period of time you will find it works exteremely well. I use mine on SSB on
160 and 75 meters, where atmospheric noise is quite high, and find I can
work stations in noise I can't even HEAR without the DSP - and you CAN
easily find useful settings for the DSP that complement the lowering of
noise WITHOUT adversly affecting SSB quality to any great extent.
Naturally, you can't just crank everything to maximum and still expect hifi
type listening quality...

The operation of the antenna tuner has nothing to do with power level - so
the answer is yes.

4115. RF protection for receiver

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-27 00:00:00 UTC
From: tswift@infi-pos.com
Message-ID: <65iokr$3la$1@news.netlabs.net>
Source record: 160855

I just acquired an ICOM "DC to Daylight" wideband receiver and want to protect the front end from RF damage. I transmit on HF, 2M, and 440.

Does anyone know of a TR switch available commercially that can sense RF over a broad range? I thought I saw something advertised recently, but failed to find it and also came up blank searching the net.

Thanks in advance,

Tom Swift

> Ed W7DXZ

If you want GOOD batteries, use wet nicads (NiCdOH) or edison cells (NiFeOH).
Their voltage is 1.2 per cell as opposed to the 2.2 of lead acid cells.
A set of 5 cells for 6 volts or 10 for 12 volts will be required.

Edison cells are hard to find, these days, since they have not been made
in years. BUT, Edison cells will last 100 years, if taken care of.
They actually get better with age, as to current capacity.
I have one small signal set that is 50 years old, and doing fine.
I have heard of others with 75 year old cells, doing fine. The
cells are basically indestructible, and ``almost never'' wear out.
The cases of wood or the rubber mounts usually rot, first, but the
cells just keep on ``truckin''.

Wet nicads should last 25 or more years. I have several 12 volt 105ah
sets that are over 20 years old, and still running fine. They can often
be found in surplus if you know what you are looking at, and the battery
lead recyclers can't recycle them easily, so they tend to sit.

Finding someone to sell you battery hydroxide for replenishment at 7-10
year intervals draws strange looks from the usual battery mongers.

If you want GOOD batteries, go wet nicads or wet Edison cells.
They last for a long, long time.

Good Luck

Bob/NA4G

4118. *TRADE: VHF Marine for SCANNER*

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-27 00:00:00 UTC
From: hamuser@aol.com
Message-ID: <19971127041400.XAA09833@ladder01.news.aol.com>
Source record: 160858

I am looking to trade my Ranger RCI-6030 VHF Marine radio for a scanner. The RCI-6030 has the following features: All USA and International Marine and NOAA weather channels, full 25 watts legal output power, Dual Channel Watch, Backlit LCD Display, and more. Current production model. Good condition with microphone. Water tight case. Looking for a portable or base/mobile (prefferably portable) with some 800 MHz coverage and preferably VHF Air Band too. Any number of channels is fine, but must be in decent condition. If you have any offers, please email me. Thanks. I am in the Philadelphia, PA area.

>They last for a long, long time.

Yes, and so will the payments. High capacity NiCds are very pricey indeed. I ended up going for flooded deep-cycle lead/acid cells designed for application in forklifts. They came with a fifteen year pro-rated guarantee, and are spec'ed for one full charge/discharge cycle per day for those 15 years. Continuously float charged, I expect they'll last as long as I care to keep them around, and they're only about 1/4 the price of the equivalent amount of NiCd (we're talking 24 volts at 750 AH, 10 hour rating).

Of course, if money's no object then I agree completely; I'd love to have a bank of NiFeOH cells.

I don't believe that the insertion loss of the ANC-4 will be material
unless the levels of the wanted signals are so low that they approach
the levels of the noise generated in the ANC-4 or after it in the
receiver. That seems unlikely on HF.

> I have S1 power line, dimmer, and computer noise at my location, the ANC-4

> I use a wider bandwidth.

The ANC-4 and similar units will be ineffective when you have more
than one source of problem noise, since they can only be adjusted to
null just one. And at that adjustment the unit may even be adding to
the other noise sources which are also entering through the noise
antenna, so things may be made even worse.

I tried the ANC-4 and found it useful many times. But the biggest
problem I had was to find a good enough noise antenna. The internal
whip and even small room wires never provided me with enough noise.
Maybe the unit needs more noise amplifier gain.

Regards,

Source record: 160872

Don't think my reply to the initial query got through.
Yes, it is correct that Func. 0 (zero) gives Memory lockout, but the first TH79's did not have this feature. Remember all the complaints about it at the time? I recollect it took around a year before Kenwood released the TH79's with the feature on them.
It's easy to check to see if you have an 'early' or 'later' rig. The 'later' rig will have L.OUT above the zero key. 'Early' ones have something else!

For all of you who seem desperate to cover 800-900Mhz, buy a European version and put up with all the other subtle differences!

I saw an 11 meter diesal standby plant in a telephone exchange.
It has meters for the following;

Oil pressure inlet/outlet.
Oil tempreture inlet/outlet.
Water pressure inlet/outlet.
Water tempreture inlet/outlet.
Rev counter.
Volts.
Load.

Does that mean it is a CB radio?

Barry

Hello!.

Thanks for reading this article.

I've got a nice condition Advance Instruments oscilloscope mainframe (made in UK), model OS-2100, with the OS-2003X and OS-2002Y modules installed. I have the manual / schematics for the mainframe, but not for any of the modules... Is there anybody who could supply me a copy of these manuals?. I would like also to find other users of these oscilloscopes.

Thanks and best regards.

You are so proud of the fact that the US had to allow its people to spell
any way they wanted because it it is impossible to educate an American.
In the real world a meter is not a measure of distance unless you define
the size of the meter. You are like sheep. You just go along with what
you are told instead of realising how stupid it is. To be consistant
you should quote times as MM:HH:SS. Why don't you? Because your leaders
don't tell you to.

4144. 3865 - Totally Disgusting Filth

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-28 00:00:00 UTC
From: deerrenee@aol.com
Message-ID: <19971128140301.JAA15222@ladder01.news.aol.com>
Source record: 160685

3865, the home of at least one equipment info net, has turned into a real cesspool on 75 meters. Appearing almost nightly is extremely foul language and bullying threats.

The main culprit is a West Virginia ham who almost nightly gets drunk and become an extremely vulgar and threatening bully. The only entertaining feature is that he LIES COMPULSIVELY, claiming things completely delusional in nature (he has an MD and three PhD's, he is a former CIA agent, etc). He turns on his so-called friends, cursing them and threatening to go to their homes and beat them up (why they kiss and make up the next week is hard to explain).

Of course he "founded" and "built" 3865, whatever that means. When he has been really drunk, he has threatened to kill people who have checked into one of the vintage-equipment swap nets on 3865. He is usually able to attract some other foul mouthed people to continue their diatribes late into the night.

WORD TO THE WISE: avoid 3865 and this guy's buddies like the plague. They are all a bunch of foul mouthed idiots.

Hi John--

I've had one in my car for about 9 mo, and it seems to work fine. The display gets pretty hot in the summer because of the incadescent backligh. Also, the squelch is pretty touchy to set up--and it is somewhat temperature sensitive (as the car warms up, the squelch point changes). Finally, the tone squelch has an annoyingly long tail (at least it HAS tone squelch on receive--most other radios don't). Those are about the only bad things I can think of to say about it. On the plus side, I've tested it on the bench and found it maintains good sensitivity and near-full RF output over its entire (easily expanded) range. Best of all, it is cheap! I'm not sorry I bought it.

I am getting a dead Dentron GLA-1000 and am gathering info. to repair it.
I'd appreciate any helpful replies to the following questions:

1. Where might I find a replacement transformer, and what should I
expect to pay for it? (I am guessing that is what I will discover to
be
the problem with it.)

2. I read somewhere that some were replacing the 6JE6/6LQ6 tubes with
Svetlana EL509's - any actual experiences and suggestions? Cost?

3. I also read that, with a change of filament voltage, one may modify it
to use the MUCH less expensive (than 6LQ6) 24LQ6s ($7.50 - 14. vs
$25-35 ea) or 32LQ6s (unable to locate) . - comments and/or
experiences with this?

4. I'm running a 440SAT, is the input swamping resistor adequate for
input VSWR?

5. Anyone run Measures high speed switching parts kit for TX/RX
and VHF-Q parasitic suppressors on these amps? Comments?

I have had an AR-146 for several months now. I use it for backup emergency comms for our Amateur/ Red Cross working group. The rig performs very well. TX audio seemed good. Receiver works well also. The only minor issue with me was the internal speaker. It started to rattle with volume only half way up. An external speaker cured that problem completely. I found power output as was advertised. I recomend the radio to anyone. Its a great deal, and is very similar in performance to the Kenwwod TM-241A.

Happy Holidays

Sony fixit in Burbank, CA has a cable assy that breaks out to 3 RCA plugs for one of Sony's camcorders. It's unfortunately about $22, but it may be the only aks that breaks out all 4 signal paths (counting the common ground). Unfortunately, it appears that all the Yaesu accessories only carry the contacts that are necessary, so they can't be used as connector sources for a general purpose application.

Has anyone been able to get a connector out of Yaesu yet??

> to check for it)

Er not to pick nits...BUT...

On the FM band in the US, 100 mw out would NOT be legal...

AND, if you're talking about the FM-10, it is a myth that it puts out
100 mw (they're AM transmitter may, however)...the FM-10 and FM-10a
only put out about 8-10 mw in stock configuration. Although, with a
few simple mods invented by squest it is possible, with the stock
transistor, to get 200-250 mw out of an FM-10. Technically, the part
is rated at 250 mw but if you want to do that mod, you want to drop
a little top hat heatsink on top. =-)

Oh yeah, although I'm not directly responding to you here...in it's
stock configuration the FM-10 can cover much more than 300 feet with
a well designed and properly located antenna. =-)

Hi,

I've collected too many projects over the past 20+ years and time to reduce the collection. This receiver is too big and heavy! so....it's the first item on the list to go. It has been in warm and dry storage for 20+ years and will clean up to excellent+ condition. It's just dirty/dusty...no
nicotine. It works but i suspect it needs either new tubes or an alignment.
The "S" meter just doesn't seem to read as high as I would expect it to on loud signals. I have the original manual with it. The cabinet has original

paint with no scratches, dents, or rust. I haven't seen many of these receivers that haven't had the cabinets repainted. Anyway, i'd prefer local
pick up or will meet someone up to 100 miles from Boston, MA. $125.00

73,

Chuck...K1KW tel # 508-779-5051

No schematic comes with it. You could just go ahead and try a direct
connection, or a cable using a passive noise filter in-line, and see
if your transmit audio is noisy.

One caution: automotive electrical systems can have some nasty transients
on them at times. They can well exceed the 16 V max. input voltage of
the FT-50. A direct connection or even a passive noise filter will
not protect the radio against these, so plug in the cigar lighter plug
after the engine is started and disconnect it before shutting off the car.

I don't know if the Yaesu official lighter plug cable protects against
these transients, but it ought to.

Dave

actually it runs about 22 milliwatts with the high power strap. If you mean the FM25. If you look at the FM10 its more like 10 milliwatts. None of the above are legal in the US with a good antenna! Its not output power but field strength. I run an FM25 into a 1/2 watt amp and feed a radioshack dummy load. I get a good pattern and am very legal. On the other hand run 10 milliwatts into a nice groundplane and you'll be outside the rules....73's

That's probably a 6JS6A, used in Yaesu FT101B thru EX series
transcievers as the transmitter final amplfier (x2) and other amplifier
applications. Available but becoming increasingly scarce and expensive.
Try Antique Electronc Supply as a source.

I Have an EPSON NB-SL/25 notebook computer I would like to trade for a
Yaesu FT101E or possibly a General Coverage HF digital receiver. The
following is a description of the EPSON:

EPSON NB-SL/25 Notebook Computer 9"x11"x2"
12 MB RAM
80 MB Hard Drive
VGA 640X480 Grayscale
386-25 CPU
PS/2 Mouse
Intel 400/E 14.4K Modem
2 extra batteries
Carrying Case
AC Power Supply
Windows 3.1
MS Word 6.0
MS Internet Explorer 3.01 for windows 3.1 (ready to dialup your ISP)

I use this system for writing papers and for field hookup to the internet.
It has been a good reliable system and is in excellent condition.

If you are interested, please contact me at rbriver@cybcon.com

Hi All,

I have three(3) packet stations for sale. $ 525.00+shipping COD

Qty 3 - RS HTX-202, 12V battery pack, no antenna, no slide on battery

Qty 3 - KPC-3, Version 6.0 32K RAM, Installed 9VDC battery

Qty 3 - connectors between HTX and KPC-3

You must supply connector between KPC-3 and computer.

Comes with SUPERFAX II, V3.1 software, used for WEFAX

TRIMBLE GPS, used for APRS, comes with connector to KPC-3. TRIMBLE is
built into a metal can. $ 190.00+shipping COD

Thanks, Lawrence NH6NJ

4181. HELP! Anyone Have Info On 6J56A Tubes?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-28 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bcfba2$6c17bce0$0a8a92d0@bitnet.bit-net.com>
Source record: 160759
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I have scratched around the Net, but not come upon a tube listing that contains this tube. Is it rare? What does it cost? Are there direct (or simple mod) substitutes?
This tube is used in a 100w amp I am looking at - need to know if I am getting something that will be more expensive to retube than to buy!
Thanks in advance for info or leads!

I am considering buying another VX-1, this one for my wife. The first VX-1 I bought has been a great little radio.

However, I have been hearing of changes to the VX-1 so that it is no longer modifiable. Supposely, diodes have been removed from the radio that are necessary for its modification. The new ADMS software supposedly has some way of opening up the unit. Has anyone tried this?

I'd like to know whether anyone has recently worked on their VX-1s.

No, it is not settled. There have not been any test cases. Now, if your mail reader was fax software that automatically sent the output to a printer, then you might have a valid argument.

While it is not, as of yet, illegal - it is still very distasteful to most people. The various no-spam delete lists have millions of addresses on them. Unfortunately, some of the trash that call themselves e-mail marketeers use these lists to build their own lists.

Most service providers prohibit spam or UBE (unsolicited broadcase e-mail) messages. If you can figure out the provider, which is often hard to do as most of the current UBE/spam software hides them very well, then a message to abuse@spamming.site or postmaster@spamming.site usually gets them shut down promptly.

Congress is working on this - but progressing very slowly. You might be able to speed it up by sending periodic examples of the trash you receive to your representatives/senators.

Accordingly to General Electric catalogue dated 5/1946 (yes I know its
not the A-model):

6J5
General Description
Principal Application : The type 6J5 is a general purpose triode
amplifier designed for service as a detector, amplifier or oscillator
tube. Its electtical characteristics are identical to the type Gj5-GT
except for lower interelectrode capacitances.

Mounting Position: Any
Direct interelectrode Capacitances
Grid to Plate 3.4 pf
Input 3.4 pf
Output 3.6 pf
pin 1 Shell
Pin 2 Heater
Pin 3 Plate
Pin 5 Grid
Pin 7 Heater
Pin 8 Cathode

Maximum Ratings
Design center Absolut
Plate Voltage 300 330
Grid Bias Never Positive
Plate Dissaipation 2.5 2.75 Watts
Total Cahode curr 20 22 milliAmps
D_C Heater-Cathode voltage 90 100 Volts

Characteristics and typical operation
Heater Voltage 6.3 Volts 6.3 Volt
Plate Voltage 90 250 Volt
Grid Bias 0 -8 Volt
Amplificaion Factor 20 20
Plate resistance 6700 6700 Ohm
Transconductance 3000 2600 Micromhos
Plate Current 10 9.0 Milliamps

Notes:
The d-c resistance in the grid circuit should not exceed 1.0megohm,
under maximum rated conditions
Direct connection between heater and cathode is recommended

Source record: 160780

I have an original owner, non smoker, PRISTINE, TS940SAT for sale...

The SN is 7100016....It is equipeed with the "Banker", which allows front panel access to the memory channels. Also, equipped with an International Radio 500HZ CW filter. The antenna tuner came from the factory. Have the Service Manual.

This rig has been used sparingly the last few years. It perform flawlessly. It is electrically and cosmetically in mint condition.

Price is $1100 shipped...

Thanks and Happy Holidays to all

Lou- N2TU

Excellent condition. Selling my Kenwood 742. I don't use 220mhz and bought another radio. This was base station. Unfortunately, no box or manual but can supply photocopy of manual if you want it. Used strictly as base. No mobile usage. About 2 1/2 years old. $800 + Fedex COD.

Also have an Astron RS-20 for $90 + Fedex COD.

Hello All,

I have an excellent R4B receiver for sale, Serial #10198R. The cabinet and face are 9.5 of 10 - no visible flaws. The chassis is 98% perfect, bright and shiney like a brass lamp. The receiver works 100%, no AC hum. Asking $200 plus ship. I have a very nice original manual for $15 as well.

>From: Wendell Smith <wendell@mc.net>
>Subject: 2m transverter/amp experiences?
>
>I would like to explore 2m ssb and build my own equipment. I am considering
>the Tentec 2-10m transverter or the Hamtronics tx and rx transverters. Any
>experience with either? Any other sources to consider? Also, I would like to
>build a 2m linear amp, say 1-10 watts in, 50-100 watts out. Hamtronics can
>get me up to about 40watts. Again, any thoughts?

I have seen the classic Microwave Modules brand transverters at the
hamfests for about $100. With the new FT-847 and IC-746 coming out,
expect there will be more on the market in the next 6 months. Good way
to go. You also might want to consider Down East Microwave products.
Check out www.downeastmicrowave.com

Regarding amplifiers, perhaps you can find a broken Mirage. I bought
one for $25-$45, gott new finals and nursed it back to health. You also
might want to look into CCI (Communications Concepts Inc?) kits that are
in QST which are based upon Motorola RF transistor application notes.

>------------------------------
>

>From: Tracy Hooker <thooker@zianet.com>
>Subject: Remote Base radio???
>
>I would like some input on a radio for a remote base. I was really wanting
>to find an ICOM 22U, but have been unable to locate one. What are you remote
>base operators using in your systems? We dont need much power, but will
>eventually need tone encode. We have a controller that puts out BCD signals
>for controlling frequency.

Tracy, you might want to consider the KDK FM144-10SXRII listed above,
since it has aircraft style BCD tuning. Also in the same category are
the Kenwood TR-7400A, Midland 13-510A, and most other early synthesized
rigs from the late 1970s.

I have a 97 Mercury Sable and I am looking to install my Alinco DR600 2m/440m mobile rig in it. I am trying to find some other hams who may have installed gear in this vehicle (or a 97 Ford Tarus). Any information on successfuly setups would be helpful. Also information about what kind of antenna setup you have would help as well. I'm looking to do either a trunk mount or glass mount. Not sure which will be the best route. My mobile rig has a remote kit which I am considering as well. I've found that there is not much room for a radio in this car. Well, any help, advice, or comments would be appreciated. Thanks.

Hi. My name is TRouBLe MaKer. I have a ham and scanner related web site. Now, it is very easy to navigate (frames installed) !!

The contents are as follows:

- What's new ? (IC Canada Update etc., link to IC Canada's web site)

- Montreal Area Repeater Directory (including hidden illegal repeaters.) There is also a link to a page where you see all VE2 and VA2 (the province of Quebec) repeaters.

- Amateur Radio Basic Qualification Study Guide (online full version)

- General Information Sheet for Amateurs and Pros

- Amateur Radio Freqs and Countries concerned

- US Amateur Radio Exam Page

- Ham frequencies and British Columbia Frequencies

- Ham calling frequencies

- Ham license structure worldwide (Canada, US, Japan, Australia, New Zealand... and there are links that help you to obtain the Australian and New Zealanders license while you stay there !!)

- US Frequency Band Allocations (for each license)

- Amateur Radio Satellite Frequencies

- Space Station MIR Information Centre

- Amateur Radio Station Prefixes

- Royal Canadian Mounted POLICE 10 codes & International Q code list

- International Morse Code

- CB Information Desk

- International Air & Marine Frequencies

- Propagation General Information Centre

- HF Propagation PREDICTION online

- RS Scanner Info

- ADI's AT-600 Dual Band Information

- Cellular Phone Listening Centre (Cordless Phone will be
added soon !!)

- Radio Modification Centre

- VE7JPN & VA2QRU Station Equipments

It's at

http://www.radiotelephone.net/amateur/

See you there !!

4228. Daiwa CNW-518 tuner

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-29 00:00:00 UTC
From: Rudy Marcelletti <rudym@net-link.net>
Message-ID: <01bcfcd1$ad888120$48e531cf@rudym>
Source record: 160641

Does anyone have a service telephone number and/or address where I can send my Daiwa tuner in for repair?

Also, has anyone had any problems with the Daiwa CNW-518 2.5 kw pep cross needle 80 through 10 meter antenna tuner. When switched in, mine does not tune anymore and nothing seems to be owtwardly wrong with any of the visible componants inside. I have not totally dismantled it and tested indivdual componants yet, but wonder if someone could steer me in the right direction.

Rudy, K8SWD

4236. Home Electronic Weather Stations with HF amateur radio stations???

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-29 00:00:00 UTC
From: "David E. Shelton" <ku4it@bellsouth.net>
Message-ID: <34806371.33DA@bellsouth.net>
Source record: 160649
Cross-posted to:
sci.geo.meteorology,alt.talk.weather,rec.radio.amateur.equipment,rec.radio.amateur.packet,rec.radio.amateur.misc

Thanks for reading,

I am a weather buff. I am interested in setting up a home weather station to have several of the benefits from the info that would be provided. The anemometer would be very valuable because of the wind speed and direction in relation to my antenna array, ie: which direction to leave my beam pointed when wind speed exceed 35mph. Rainfall, temperature, and barometric pressure are always nice because of the forecasting insight they give. Lastly I'm tremendously curious regarding weather data.

Well this my dilemma, I was all set to purchase a Peet Bros. Ultimeter 2000 when it came to my attention that an amateur in the Atlanta area who is primarily a DXer, as I am, bought and setup the Ultimeter 2000 in his shack and little did he know that the CPU gave off a S9+ noise level on the 20M band. After working with Peet Bros. for a couple weeks or so the problem could not be resolved. So this is my question, currently is there any amateur ops out there that use Davis or any other reasonably priced weather station that does not have this problem when setup in your shack.

AFAIK, the term doublet is just a colloquial name for a Hertzian dipole.
It doesn't imply that the dipole is resonant at the operating frequency.
The term "Center Fed Zepp" would appear to be an oxymoron since the
Zepp is an end fed halfwave antenna with stub matching.

From: Richard Mudd <rickmudd@teleportREMOVE.com>
Message-ID: <01bcfcf3$107225e0$cd79a3ce@dad>
Source record: 160658

I picked this up from Packet...

Hello from KC7NKS.
I have opened both my Alinco radios, a DJ-S11 and DJ-S41t.
The modifications allow them to:

DJ-S11:
RX- 136 to 174mhz.
TX- 136 to 148.61mhz.

DJ-S41T:
RX- 400 to 499mhz.
TX- 424 to 476mhz.
==========
THINGS NEEDED:
Small phillips screw driver.
Small soldering iron.
A steady hand.
==========
The modifications are:
1. Write down all memory channels.
2. Remove batteries, leave battery cover off.
3. Take out the (7) small phillips screws on the back of the radio.
4. Remove back cover.
5. To the left side of the speaker next to the side of the case
you will see a very small green resistor (about the size of a
flea) YOU MUST REMOVE THIS RESISTOR.
This resistor is all by itself on the board so there is
little chance of damaging other items.
Using the small soldering iron hold this against the resistor
until you see the solder melt then flick the resistor off
the board with the soldering iron.
6. Reassemble the radio.
7. The book says to reset your memory but several of my friends
have not and their radios work fine.
8. THATS IT YOU ARE DONE.

Good Luck and Enjoy!
73's KC7NKS Dale

>Gee, gives me alot of inspiration to learn the code and upgrade to a
>higher class.
>Higher class of bullshit.

Upgrade and use the other 99.9% of the spectrum where these fine people don't operate. 3865 is like some of the bottom feeding repeaters in big cities. It serves a useful purpose by keeping most of the lids occupied in one spot so the rest of us can work around them.

So chill, smile, enjoy. It is a good life and upgrading really is worth it.

Can anyone advise me as to a fair value for these two units? I was considering offering them as part of a trade.

Also, if I don't trade the Sig. Gen. (just because I like the looks, is this still a useful instrument?

Gonset SuperCeiver, with two SuperSix tuning heads, control head, and an AC/PS. One SuperSix has one rear case corner cut away to fit in a VW Bug panel, the other one is OK. Everything probably works fine but needs sorting out and TLC. With manuals. Looks like all original knobs.

Signal Corps Model 172J Signal Generator, complete with case, lid, and manual. Dusty but otherwise very clean and works. Range 100 kc - 32 mcs.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.boatanchors

I have real nice Hammarlund HQ-110 which I use in my 'nostalgia' station. However, the automatic gain control (Hammarlund calls it an automatic volume control, AVC) doesn't work on CW or SSB. As far as I can tell, that's how it's supposed to be, as the instruction manual specifies manual volume control for those modes. This is, however, a pain in the neck requiring constant adjustment of the RF gain control. Does anyone know how to make the AVC work in CW/SSB mode on this receiver? Thanks.

Mike, N4PDY

I am looking for standard operating data on 4E27 and 803 tubes. I believe this information was in RCA Transmitting Tube manual in the 1950's. If someone has this information that could be copied and sent to me, please e-mail me at the address shown. Thanks.

However, the automatic gain control (Hammarlund calls it an automatic volume
>
control, AVC) doesn't work on CW or SSB. As far as I can tell, that's how
>it's
supposed to be, as the instruction manual specifies manual volume
>control for
those modes. This is, however, a pain in the neck requiring
>constant
adjustment of the RF gain control. Does anyone know how to make the
>AVC work in
CW/SSB mode on this receiver? Thanks.

Well, Mike, the AVC is just that, an automatic volume control. It is not an automatic gain control and will never act as one. That rig was before AGC curcuits were common and the AVC was never meant to work on cw or ssb as far as I recall.
The problem as I remember it was that the AVC circuit was not fast enough to work very well on SSB. Enjoy what you have the way it is or if you desire, an AGC can be added by someone who knows how to do it.

I have just acquired a KDK Model FM144-10SX II 2 Meter mobile rig for packet. Considering it's age, I guess I really should have a manual w/schematic and parts list for future repair reference.

Since this is an ancient rig, I don't suppose there are any copyright issues!
Will pay reasonable copy and postage as agreed in advance (Unless of course you'd like to OCR scan and E-mail it!).

Thanks in advance!

Source record: 160730

Hi there,

I have a Ranger Communications RCI-6030 VHF-Marine rig which I want to trade for a scanner. The RCI-6030 has the following features: All USA and International channels (156-162 MHz), all 10 NOAA weather channels, 25 watts output power (full legal power), 1 watt low power, Dual Channel Watch, Instant Channel 16, Digital PLL tuning, backlit LCD display, "water tight" casing, and more. Comes with the microphone (with channel control on mic). Very good condition. This is a current production unit, not discontinued. I am looking for a portable or base/mobile scanner (preferably portable) which covers 800 MHz (not nessesarly gapless 800 MHz), and preferably also the VHF Air Band (118-136 MHz). Any number of channels will do. Anything in good condition will also do. Please email me if you have any offer. I am in the Philadelphia, PA area. Thanks.

Try counting the individual meters that you named (give 1 meter each for in and out), and you'll see that they total 11. 11 meters. Not to be confused with 11 meters.

4286. FT-920 vs FT1000mp

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-30 00:00:00 UTC
From: Randy Knedler <randyk@khnl.com>
Message-ID: <3481E043.7F83@khnl.com>
Source record: 160490

I know this is a broad questions but based on performance and given that the MP has some additional features, is the FT-1000MP worth the $1000 additional price tag as compared to the FT-920. It's a question that I'm asking myself as I look for a new rig.

Those of you who bought the 920, are you satisfied? Would you do it again.

Those of you that bought the MP, are you satisfied? Would you do it again.

Thanks,

Randy Knedler

Steve,

I'm not familiar with the FT102, but if it has an ALC input for use with a linear amplifier, you can inject a negative voltage to reduce the output power. A small battery with a potentiomer across it can be used to adjust the voltage into the ALC jack.

Hi.

I purchased Pro-2036. It was on sale for $300 (This model is no
longer manufactured. It used to be $559.99 !!).

I would like to any mods available for this model (are there any ways
to change the freq step to 5 KHz around 800 MHz area ?? It is
possible to receive cells by using image freqs, but 12.5 KHz step
won't help).

Thanks in advance.

I have owned 2 TM-V7's for about a year. I like it
I have had no hardware or software problems with it.

I find the display outstanding at all but bright direct sun light.
Some complain about it.

I found nothing cheesy about the construction. I had a Kenwood 733 prior
to this and the V7 has much large heat sinks. If anything the V7 appears
to me to be built better.

Looking for info on Kenwood TS-50 (or other similar-sized 12V Mobile Rig.) Current Emergency Services vehicle burned up in accident/fire and it had such a rig for RACES/REACT/CAP etc. New vehicle is very small so need a compact rig with compairable specs. Info on what's out there and what I should see for prices, etc. We are a poor, rural county with no money to spend so assume a used rig.

Note: I am not a HAM, just a retired Electronic Tech with a radio endorsement - I can fix stuff but don't know what to specify for buying such - any help appreciated

I'm sure folks have been talking about this for awhile, but I'm new to the group!

I see the ADMS1D software package for sale for $38.00 through several distributors.

Quesion #1 Is the interface cable for the VX-1R the same as the FT-50R (with the adaptor at the end)

Question #2 If #1 is true is anyone intrested in trading software? I'm getting tired of purchasing packages from YAESU.. I'm on software purchase #4 now!

Any other comments or review on what the VX1R software does well and dosen't would be appreciated.

Brian

Does it do it every time it is turned off?? (If so, lithium battery)

Is the radio run mobile??? (If so, make sure the radio is off before
starting the car, even if wired direct to the battery)

If neither of those apply there is a service bulletin regarding the
reset circuit. If that does not fix it the uPc will have to be replaced.

I also have 2036 which is basically the same as the Uniden BC890XLT.
There is a mod for the 890 that re-enables the cell freqs, but I
understand this mod does not work for the 2036, although the radios are
identical. Let me know if you find any mods...

When did you pay 300.00? Not trying to tick you off, but I paid 100.00 at
R/S for this radio about a year ago on close out, it didn't have a power
supply however.

As of right now, my family owns 2 TV sets. The oldest of which is 10 years old (it works just fine). The new one is a little less than 2 years old, and we payed about $500 for it. I expect both of them to keep on working for quite some time. In addition to the above "problem" we also own 3 VHS VCR's. In addition to the above "disposable" hardware that we will have to fork out to replace, we also own on the order of $1000 worth of VHS tapes.

It *might* be nice to own a DVD player, along with some disks to play in it. As I stand in the shadow of HDTV and consider how much it's going to cost me to replace what I already own, I'm finding it hard to come up with a good reason to spend more money on an industry that doesn't seem to look at what they're about to do.

The above post is actually the first time that I've seen *anyone* say anything about the down side of HDTV other than that "gee whiz, a converter box might set the average consumer back a couple hundred bucks, but this isn't much to worry about". wake up people. This HDTV is a load of crap that the government and business is going to try to ram down our throats.

Source record: 160520

I saw a reference to mods for the ICOM IC-W32A posted here a while
ago but I searched DejaNews and couldn't find them, so I tried
AltaVista and found them!!

Here they are again...

To extend the receiver and open up 800 MHz receive (cellular blocked):

-- Turn off the radio

-- Press and hold the band and squelch buttons.

-- Turn on the radio while holding these buttons,
wait for 5 seconds before you release the band
and squelch buttons.

-- Now the receiver should be opened up as far as it will go.

To enable Crossband Repeat:

-- Set the VHF and UHF frequencies you want to use.

-- "Lock" the radio by holding down the CALL/LOCK button
for two seconds.

-- Turn off the radio.

-- Hold down the SQUELCH button (above the PTT button),
the MAIN button and the BAND button.

-- Turn the radio on while holding these buttons. The "LOCK"
indicator (a key icon in the upper right side of the display)
will be flashing, and the radio will be in crossband repeat.

To disable Crossband Repeat:

-- Hold the CALL/LOCK botton down for two seconds. The "LOCK"
indicator will stop flashing, unless...

-- if the crossband repeater is in use, holding the LOCK button
won't turn it off. If you must shut it off in that condition,
press and hold the SQUELCH button, then hold the LOCK button
for two seconds, and the "LOCK" indicator will stop flashing.

From jones1@alltel.net Sun Jul 20 09:43:46 1997

The mod for out of band transmiting is as follows:

Remove the four screws on the back of the radio and the
two screws under where the battery is.

Lift off front of radio(keypad). This is the logic unit.

There is a chip diode at the back of the logic unit.
The number is D523. Remove that diode and it will allow
transmit out of band on both 2 meters and 440.

I also found this while searching...

I just purchased the Icom IC-W32A handheld to replace my FT-50R.
Unfortunately, I could not find a mod to make the IC-W32a cover the CELL
band (the FT-50R DOES cover this freq range!). However, I learned that the
mod is NOT necessary.

The 1st IF for UHF in the IC-W32A is 46.05 MHz. All you have to do is
double that frequency (= 92.1 MHz) and then add that freq to the desired
receiving frequency. So, to cover the CELL band with the programmable
scanning limits:

870 MHz + 92.1 MHz = 962.1 MHz
890 MHz + 92.1 MHz = 982.1 MHz
** set the scanning step to 30 KHz.

The radio receives this freq range very WELL with no attenuation what so
ever (as far as I can see and hear). As a matter of fact, I was listening
to a known local utility on 855.1125 MHz. The very same station appeared
at 947.2125 MHz and the signal strength was EXACTLY the same as that on the
original frequency. I suspect that the manufacturer overlooked this flaw
on purpose, he he.

Have Fun,
Scott

From: Len Schaier <schaier@avotec.com>
Message-ID: <348224AC.6111@avotec.com>
Source record: 160523

Hello All,

I will be using my TS930s to drive an SB220 I recently purchased and will be receiving in a few days.

The TS930s has an the internal relay intended to operate an amps T/R relay. One side of the NO relay contacts is grounded to the TS 930 and the other side is brought out to a DIN connector for the amp.

I do not know the SB220's relay drive requirment except that I believe you ground the low side of a relay whose high side is at approx 120 volts. Likewise the manual for the TS 930 does not state its relays capabilities nor the capability of the wiring at the Din connector.

Assuming all parts and connections are as designed, is the relay, wiring and connector in the TS930 compatable with the TR circuits of the SB220.

Thanks in advance.

Len

I am impressed with the construction. Only exception is reflections on
front panel make it hard to see in day light.

Just wondering what the general
>concensus is on this mobile.

I love mine. Makes an excellent aircraft band receiver. I also use it to
monitor my commercial repeaters.

Is the software available yet?

Nope. The EZ Clone project died. Kenwood says they will have their own
software out in early 98.

>How does the V7A sound? How does it hold up in the real world?

I think the audio is great. I use an external speaker. The small internal
is OK but I prefer the external.

Simple mods will extend tx & rx range.

The mike stays hot audio even when not keyed. This causes problems if you
are repeating or using dtmf control.

I use my TH-79D HT to remote control it. That works great.

Intermod is fairly bad on UHF receive, but not much worse than many other rigs.

The radio is in excellent condition, rarely used. I have the carrying strap but I've misplaced the manual and thrown away the box long ago. The radio works great and is more sensitive than the SOny 2010 that I used to own.

I am willing to trade up/down for another SW radio or scanner. Please e-mail with description/condition/price of your item for trade.

I would like somthing smaller for traveling or a larger
desktop with a random freq keypad. I'm also looing for a color laptop 486>.. I figure a fair used price on this radio is $325.

That big knob, generally located towards the middle of the front, will help you avoid 3865 and several other spots on the bands, also there is an on and off switch that works wonders at killing this nonscense. Get down to cw now and then, it's clean down there. If you don't know the code, there are code readers for your pc that will interpret and TNCs to install to let you enjoy all the amateur digital modes.

I have a Titan amp for sale. It is just back from a check up at Ten-Tec, where it had the vacuum relay replaced. Also, Ten-Tec gave me new packing material & new boxes.

It both tubes were replaced in February, 1997.

I am the second owner, and have not used it (except for finding out that the relay was bad) since I bought it in May 1997.

It is is perfect condition, except for a hair-width scratch on the rearmost, right side of the RF deck cabinet. The scratch is not visible unless you view it head on.

It also included the manual, and all service records.

$2000.

Please contact via e-mail if interested.

> 73 Doug

Hello Doug,

I Have done some research for a regional media company on this issue and you may not be far off the mark. There is some real concern about a developing market of TV have and have nots and what the impact will be on ratings and advertising sales. $200 - $700 IS a lot to pay for a converter box just so you can use your old TV. The projected prices for the all in one HDTV sets range from a low of $1,000 all the way up. There is even a possibility that broadcasters will not use all of the bandwith given to them for "free" HDTV. It is possible to use a lower quality version of HDTV at reduced bandwith and then sell premium services with the remaining allocation.

Several years ago there was a "trial baloon" floated within the Clinton administration concerning the Federal Government subsidizing these converter boxes for families who could not afford them. This is not as strange as it sounds

since Newt Gingrich has spoken on the possibility of subsidized computers and network connections for the poor. There could be support from both sides of the aisle on both of these concepts. Wired Magazine recently published some very insightful articles on this subject.

WireHead Prime (wiredone@raccoon.com) wrote:
: On the FM band in the US, 100 mw out would NOT be legal...

They get away with selling them from Ramsey because they are
exempt (kits) and the builder must comply with FCC rule.

: AND, if you're talking about the FM-10, it is a myth that it puts out
: 100 mw (they're AM transmitter may, however)...the FM-10 and FM-10a
: only put out about 8-10 mw in stock configuration.

I would like to say 2 or 3mw myself. It ain't much that's for
sure. A longer antenna helps, but a more efficient RF final is better.

: Although, with a
: few simple mods invented by squest it is possible, with the stock
: transistor, to get 200-250 mw out of an FM-10.

I was just going to say that. :) Plus, the parts needed to do
the mod to 250mw can be had at any Radio Shack. The mod to go up to
.940mw you need to purchase the transistor from an ECG, SK, or NTE dealer.

: Technically, the part
: is rated at 250 mw but if you want to do that mod, you want to drop
: a little top hat heatsink on top. =-)

Gets warm, but it won't die. I have an NTE-23 running without
heatsink right now, been running since turkey day. :) Output = 940mw
approximate. :) Running from a modified "Sound Feeder". :)

: Oh yeah, although I'm not directly responding to you here...in it's
: stock configuration the FM-10 can cover much more than 300 feet with
: a well designed and properly located antenna. =-)

Up high, to radiate out. :) 3rd story apartment advantage, eh
WireHead? ;)

I also performed the mod and it works great. I did notice one strange
thing, if you attemp to transmit out of the normal 2mtr band (in the
150 Mhz range) the display will blink for a few seconds and then start
transmitting. It may be some kind of internal tuning device that
senses that the output is no longer tuned properly (higher swr).

The resistor is very small. Care must be taken when removing it. The
nice part of the extended receive is the ability to receive the NOAA
weather broadcasts.

4345. Yaeso FT-50-RD Intermod

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-30 00:00:00 UTC
From: Doug Smith <nospam@dougweb.com>
Message-ID: <3481ABA4.929F6562@dougweb.com>
Source record: 160561

My FT-50RD is plagued with intermodulation distortion. I hear the VHF and UHF data
or paging systems on virtually every band when the unit is connected to an outside antenna
or even a mobile antenna.

Is there a know problem with the radio that can be fixed? Mine is still under warranty.

Doug Smith
WA6GON

It is a great travel radio. I took mine to Ireland and the UK and had a blast.
The monitor button become a 1750 hz burst button for us in Europe. Sure made traveling nice. ex/EI4VUY/M, M/WA6GON

4346. Best portable TV Receiver for ATV?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-30 00:00:00 UTC
From: herbr@netcom.com
Message-ID: <herbrEKH19o.8yJ@netcom.com>
Source record: 160562

I am interested in hearing comments on the "best" portable TV to use for reception of ATV video. I realize that any TV that tunes VHF will work, but what I want to know is if there is some particular brands / models that have some neat features that make them especially nice for ATV.

Things like muted audio, squelched audio, etc. Let me know your comments and suggestions. I need to buy a new 9 inch or 13 inch, for use with ATV, and would rather know ahead of time fromt he experts, especially for the nifty features you don't figure out until you bought some thing else.

Also, is there another ATV reflector out there in addition to this one?

By the way, I will be tuning the TV to Channel 3 and Channel 8 for inputs from the down converters.

Thanks and 73.

>
> Thanks & 73... Mark AA7TA

I replaced all 3 of the bulbs in my FT-5100 after they burned out over the course of several years. You can order replacement bulbs from Yaesu USA for a reasonable price. They have flexible leads, and are soldered into the front panel.

Getting the front panel dissaembled to the point where you can access the
bulbs took me about 2.5 hours since I did not have any drawings of how it comes apart. You have to disconnect some flexible ribbon connectors, remove all the panel knobs, and take out some screws. Be careful when you do this, as all the push buttons will fall out at the same time.

Then you unsolder the bulbs, clear the holes with some solder-wick, and solder in the new bulbs. Be careful doing this as the leads are near several surface-mount parts, and you can pull them right off if not careful.

After I got it all reassembled, it worked fine. Since my radio is on 24 hours a day, I adjusted the panel lighting down to no illumination (the manual shows how to do this). This way the replacements will not burn out so quickly.

>as
>I recall.

[deletions]

"Automatic volume control" versus "automatic gain control" is merely a difference in nomenclature, not necessarily in underlying principle. It merely happens that in the years during which the technique was called "AVC," the means *usually* employed to achieve it usually disallowed its success during heterodyne reception. The use of the word "gain" merely became more fashionable than "volume," especially in fields related two-way communication.

The "AF Gain"control on most current ham transceivers achieves its function through exactly the same means--a potentiometer that adjusts the AF voltage applied to a stage--as the "Volume" control on a Philco broadcast set from the 1930s.

From: herbr@netcom.com
Message-ID: <herbrEKH571.8nA@netcom.com>
Source record: 160571

I have a Kenwoood Tm-733a. I am trying to change the VHF - UHF memory ratios. According to the manual on page 41, this should be accomplished with [F] + [MR] + POWER ON. But, this has no effect.

I realize that all memory channel will be lost, but I wait to have 60 memory channels on 2 meters, and 10 on 440.

Is the manual wrong on this, or am I doing something wrong?

Thanks.

The HDTV transmissions will not be at the cost of elimination
of regular TV channels. There will be a period of time (10
years) when both types of signals will be available. In that
time, it is very unlikly that most (not all, but most) people will
have migrated to HDTV by purchasing at least one HDTV set.

You might want to "sereously" consider forgetting the whole thing. Mom
and Dad may become "sereously interested" in your activities when the
Federal Marshals knock on the door of the family home intent on
confiscating every piece of electronic apparatus within. You might be
"sereously" in trouble.

Let me see if I have this straight...

You know how to make $100,000 every 60 days. Right? So why are you wasting your and our time pestering the newsgroup with your ads?

What this tells me is that you are convinced that you will make more than $100,000 in sixty days by selling this information rather than doing what the information tells you to do? Am I right? Do I have a handle on this?

Are there enough people out there who are gullible enough not to have worked this out for themselves? No, I don't think so.

I think the person that is most gullible is the idiot that bought into selling this scheme on the internet with these idiotic postings. As a rule, I never buy anything from an idiot. Especially information.

You know, I own some property in Florida you might be interested in. The property is special in that it is federally protected, which means that you will never have to worry about encroachment by neighbors or land developers. The really good news is that it costs considerably less than $100,000...

ALL EQUIPMENT RUNS AND LOOKS LIKE NEW. NO JUNK.!!!!!

For Sale: Please make an offer on any or all items.

ICOM 781 with mic and ALL manuals. Deluxe machine and
operates perfectly. Looks good and hate to part with it!
List ($ 6649.00) WAS $ 3825 NOW $3600 and shipping.
Need the money.

Force12 "Dxer" beam antenna. Covers 20,17,15 meters.
In new condition. "It is the hottest beam I have ever used in 35
years."
List New ($ 900.00 plus ship) $ 540 and shipping.

SB220 amp. 80-10 meters. Good tubes and ALL mods.
have been installed. Shows 1800 to 2000 watts PEAK, on voice,
output to a bird watt meter. $ 625 and shipping.

Kenwood TM241A 2meters. 50w. $ 175 and shipping.

Also have two winches for cable: Tulsa Wench... 8000lbs with PTO,
and one horse 115v motor, 200lbs weight with frame---$ 300 .

1/2hp Dayton gear head with spool...$100 Both used to lift towers U
ship..

4375. Re: Need AVC help on Hammarlund HQ-110

Newsgroup: rec.radio.amateur.equipment
Date: 1997-11-30 00:00:00 UTC
From: n2ey@aol.com
Message-ID: <19971130005100.TAA29778@ladder01.news.aol.com>
Source record: 160607

Yes, your HQ-110 is operating properly - they only designed the AGC/AVC (two terms for exactly the same thing) for AM use, because it's easier and cheaper that way. The S-meter also only works on AM. Here's why:
Most hollow-state receivers designed before SSB became popular (and low priced ones) used a simple diode detector that also provided AVC/AGC voltage. The AGC/AVC voltage is obtained by rectifying and filtering the incoming signal (carrier). This same circuit is used for CW/SSB reception by injecting the BFO signal, so that you get an audio tone on CW or non-Donald-Duck audio on SSB. Trouble is, in the simple diode circuit, the BFO voltage, which should be much larger than the signal for proper demodulation, gets rectified and produces a large, constant AVC voltage that bears no relation to the incoming signal. So the circuit is designed so that the AVC line is grounded and/or opened, and you use the manual RF gain.

In "modern" receivers, and older ones of more advanced design (the '110, although a very fine piece of gear, was Hammarlund's bottom of the line hambands only receiver) the problem of AVC is dealt with differently. For AM there usually is the diode circuit described above, and for SSB/CW there's a product detector and a completely separate AVC detector that is isolated from the BFO, so that it actually works on SSB and CW. Things get quite complex, and adding such a setup to an existing receiver is not the easiest thing to do.
A simpler approach was to derive the AGC from the resulting audio ("audio-derived AGC) by rectifying and filtering the detected signal. Although this works, it's hard to get a fast enough "attack" time to avoid getting your ears blasted.
I'd leave your vintage Hammarlund alone, and enjoy it for the classic it is. (How I longed for one in my Novice days!)

Actually, there is a big advantage to manual RF gain and no AGC in CW and some SSB reception. The trouble with AGC is that even the best systems respond to everything in the passband. So if you are trying to copy a CW signal tuned in to a 750 Hz beat note, and another signal shows up anywhere in the passband of the receiver, the gain of the receiver is controlled by the combination of the two signals. Since both are intermittent in nature (on-off keying), the gain of the receiver jumps all over the place. Even if the signals are far apart enough in tone for you to separate them mentally, you now have to deal with the varying gain. Unfortunately, most "modern" gear won't let you turn off the AGC, so you are stuck with trying to minimize the damage by reducing the RF gain and running up the audio gain. For some reason, only the most expensive stuff made today lets you turn off the AGC.
Maybe they don't like CW?

You can find quite a bit of info at:
http://www.navcen.uscg.mil/marcomms/boater.htm

Here is the answer to your question from that site.

U.S. VHF Marine Radio Channels and Frequencies

Channel Ship Ship Use
Number Transmit Receive

01A 156.050 156.050 Port Operations and Commercial.
VTS in selected areas.
05A 156.250 156.250 Port Operations. VTS in Seattle
06 156.300 156.300 Intership Safety
07A 156.350 156.350 Commercial
08 156.400 156.400 Commercial (Intership only)
09 156.450 156.450 Boater Calling. Commercial and
Non-Commercial.
10 156.500 156.500 Commercial
11 156.550 156.550 Commercial. VTS in selected areas.
12 156.600 156.600 Port Operations. VTS in selected
areas.
13 156.650 156.650 Intership Navigation Safety
(Bridge-to-bridge). Ships >20m
length maintain a listening watch
on this channel in US waters.
14 156.700 156.700 Port Operations. VTS in selected
areas.
15 -- 156.750 Environmental (Receive only). Used
by Class C EPIRBs.
16 156.800 156.800 International Distress, Safety and
Calling. Ships required to carry
radio, USCG, and most coast
stations maintain a listening watch
on this channel.
17 156.850 156.850 State Control
18A 156.900 156.900 Commercial
19A 156.950 156.950 Commercial
20 157.000 161.600 Port Operations (duplex)
20A 157.000 157.000 Port Operations
21A 157.050 157.050 U.S. Government only
22A 157.100 157.100 Coast Guard Liaison and Maritime
Safety Information Broadcasts.
Broadcasts announced on channel 16.
23A 157.150 157.150 U.S. Government only

24 157.200 161.800 Public Correspondence (Marine
Operator)
25 157.250 161.850 Public Correspondence (Marine
Operator)

79A 156.975 156.975 Commercial
80A 157.025 157.025 Commercial
81A 157.075 157.075 U.S. Government only -
Environmental protection
operations.
82A 157.125 157.125 U.S. Government only
83A 157.175 157.175 U.S. Government only
84 157.225 161.825 Public Correspondence (Marine
Operator)
85 157.275 161.875 Public Correspondence (Marine
Operator)
86 157.325 161.925 Public Correspondence (Marine
Operator)
87 157.375 161.975 Public Correspondence (Marine
Operator)
88 157.425 162.025 Public Correspondence in selected
areas only.
88A 157.425 157.425 Commercial, Intership only.

NOAA Weather Radio Frequencies

WX1 -- 162.550
WX2 -- 162.400
WX3 -- 162.475

WX4 -- 162.425
WX5 -- 162.450

WX6 -- 162.500
WX7 -- 162.525

Frequencies are in MHz. Modulation is 16KF3E or 16KG3E.

Note that the letter "A" indicates simplex use of an international duplex channel, and that operations are different than international operations on that
channel. Some VHF transceivers are equipped with an "International - U.S." switch for that purpose. "A" channels are generally only used in the United States, and use is normally not recognized or allowed outside the U.S.

Boaters should normally use channels listed as Non-Commercial. Channel 16 is used for calling other stations or for distress alerting. Channel 13 should be used to contact a ship when there is danger of collision. All ships of length 20m or greater are required to guard VHF channel 13, in addition to VHF channel 16, when operating within U.S. territorial waters. Users may be fined by the FCC for improper use of these channels.

See the Federal Communications Commission's Marine VHF Radio Channels page. This page does not include frequency information, but has more complete information on the use of the channels. If you notice any discrepancy between these two lists, please notify us at cgcomms@comdt.uscg.mil.

I've got two articles in front of me. One, from the Akron (OH)
Beacon-Journal of Dec. 27 says a converter will sell for about $200.
The other, from the Chicago Tribune, quotes a Thomson Consumer
Products executive who sets the price of a converter at $700.

Unfortunately, a converter won't be trivial. The technical
characteristics are very different; the converter will need to contain
most of the circuits present in a full HDTV TV. About all they can
omit is the (admittedly expensive) high-resolution CRT.

Personally, I'm offended by both figures. I watch TV when there's big
news (OKC bombing, severe weather, etc), when the UW Badgers are in a
national championship, or if I think the DX is up. If I have to spend
$200 per set to keep watching TV, I think I'll settle for radio...

Or better yet, stay away from 14.313 MHz and 75 meter SSB nets and
meet a huge number of decent people from all over the world.

At least certain types tend to congregate in just a few, well-
defined places...leaving gobs of spectrum for the rest.

Hello All;
I'm selling a "like new" Rf-Concepts 4-110 Pre-amplified N/conn
10w-in 100-110w-out 70cm amplifier with all orignal boxes & docs.
Worked the satellites with this amp & a fantastic preamp. Reason
for sale is strictly financial. I am asking $255 + shipping OBO.
Sorry No CODs.....
Please re: me via email: n2rif@amsat.org Or Packet
N2RIF@WM2F.#SNJ.NJ.USA.NOAM. You can also try
calling but my phone is usally busy. My ph# is 609-386-9382..
Thank you for reading my bulletin. Thomas J or just T.j. -73

The Icom O2AT I have for sale is Serial Number 30005114. I bought it some where in 1983 or so. It will come with the original box, manual, charger, battery pack, and the exrtas I bought: a Cigarette adapter and a Helical Quarter Wave Antenna (longer rubber duck).

It has been a long time since I used it as I replaced it with a new radio with all the bells and whistles. It doesn't seem to put out RF. It tunes and receives fine. I don't know what it might be other than an adjustment or at the most replacing the Final Transistor. I have never done anything extreme like dropping it or smashing it against anything.

I think $75 sounds like a just price. Let me know.

Thanks and 73,
AC6IW Jeff

I've seen 'em priced all over the place, and have found 'em retail at $1244.95. There are too many for sale within $100 of this price, and I'd just as soon buy new and get the warranty and free remote-mount kit. If you have a used one for sale, in as-new condition, and aren't trying to get retail price, please e-mail me with price/details. Not interested in package deals with power supplies, antennas, duplexers, etc., just need the radio. Of course, internal filters would be welcome options! I'm not interested in the older non-MK II model. 73 all, -Web KR4WM in Myrtle Beach, SC

Hello Wendell,

I have the TenTec 6m-2m transverter and it works fine. Another good source is Down East Microwave in NJ. They carry a complete line of transverters and just about everything else for VHF-UHF. They carry the Teletec line of solid-state amps. I use the 2m and 70cm versions and they are very clean as far as intermod distortion. The 2m amp will produce about 175W out with around 40-50W of drive. Good luck and hope to hear you on next sporadic E or Meteor scatter opening.

I saw your automotive ad

Hi.
We have an online WORLD WIDE AUCTION that will tell you who
in the world wants your car & what they will pay for it.
See why everyone goes with us, we sell your car.
You can see what the high bid is & you tell us when to sell.
This is an online auction, open to all. A great way to sell
your car,truck or bike. We have all kinds available for sale, from
used cars to classics, such as a 57 Mercedes Gull Wing for $450,000.
Take a look at a 48 Tucker, Only 51 ever made & its the only one for sale
open bid is $750,000. & now our new motorcycle site. Key into one of the
largest auctions on line & either put your vehicle up there for sale,
or bid on one.
We have a special price for this, its only $50. per car
We handle all the buyers & bidders for you & also have an escrow account
to handle the money. That way there's no bad checks or funny money.
Its a great way to sell your vehicle world wide & see who the serious
buyers are & where they are from. Like all auctions our job is to sell
your car. We make our money by selling vehicles.
IF YOUR VEHICLE DOESN'T SELL, THEN YOUR NEXT AD IS FREE
What a great guarantee. So try us & let us show you how to sell your
vehicle.
VISIT OUR AUCTION AT http://scvnet.net/~classics See you there...
Thank you for your time & hope to hear from you.

If you would like your vehicle up on the auction, just key into the
auction & go to VEHICLE INFORMATION SUBMISSION FORM & fill it out.
There is a normal fee of 2 1/2 % "when vehicle is sold."
What we tell our clients is to add the 2 1/2% fee on to there asking
price now, that way the buyer is paying the fee & you only pay $50. for
the whole sale. That way you are only paying $50. to advertise your car
& sell it. That is quite a deal. We handle all the bidders & buyers for
you & verify all bids, all you do is tell us when to sell.
If you want your vehicle up there now just go to VEHICLE INFO FORM
http://scvnet.net/~classics/order.html & submit.

Hello Bob,

Yes, I received the mod from ICOM and it works. Somewhere I have a scan of the diagram and have been trying to find it. When I do, I'll e-mail it to you or ICOM Tech. Support can fax it. Mod is the removal of one diode and receive coverage is from 136-174 MHz I believe.

I am looking for any info on transverter interfacing for the IC-821. Have posted msgs on ICOM mail list but so far no response.

A friend of mine did some calculations and he found that to be close to
legal the
output of the transmitter can only be 60 MICROWATTS INTO A 1/2 WAVE
DIPOLE!!
If you read the rules they say the unit cant have any kind of antenna
connector on it.
The antenna must be fixed to the unit.
LETS FACE IT WHAT THE REGS COVERING 88 - 108 MHz ARE FOR IS LOCAL
OSCILLATOR RADIATION!!!!!!
